LevelSet Installation Guide

10-Nov-2019 Version 1.0
www.ldsdimming.com

The LevelSet device is a small module designed for installation in lighting fixtures to enable configuring the fixture power-on level to 50% (default, 65%, 80% or 100%. There is no need for a dimmer or different wall switch. The existing on/off switch is used to change the level. All fixtures on the circuit should have the LevelSet module installed to have their power-on level be the same.

Manual Switch on Back
(press through heat shrink)

- The LevelSet device does not contain an address or other identifying information. This means that any LevelSet device be installed in any fixture. The default level is 50%. You can always increase the power to 65%, 80% or 100% if the need arises.

There are several reasons that 50% is the default level:

- Most people, especially working with computers prefer a lower level, Reduces LED glare
- Most people can barely tell the difference between 50% and 100%, the eye adjusts for light level automatically.
- 50% saves 50% of the energy (electric bill) – forever
- 50% power makes the LEDs and Driver run much cooler – extending the life and eliminating maintenance
- You can purchase the higher power fixtures in the product line, which are often the same price as the lower power and set the level as desired later. Buy the 50W version for all jobs, instead of the 40W or 30W versions
- Once the ON level is changed it remains at this level, even after lights are turned OFF and ON, until the LevelSet procedure described below is used to set to a new level.

Manually changing the light level with internal tact switch – there is a dome switch on the back side of the Level Set module about where the ETL logo is. Pressing it changes the level by one step. This is useful for testing the Level Set module with your model of fixture before installation. Each press changes the light level by one step.

Changing the level with the wall toggle switch, follow this procedure.

1. Fixture should be on for 1 min or more, if not turn it on for at least 1 min
2. Turn the fixture off for at least 1 min (*with most fixtures 20 sec is OK*)
3. Turn the fixture on and wait 5 seconds, be accurate – use a watch
4. Turn the fixture off at least 1 min (*with most fixtures 20 sec is OK*)
5. Turn the fixture on and wait 5 seconds, be accurate – use a watch
6. Turn the fixture off at least 1 min (*with most fixtures 20 sec is OK*)
7. Turn the fixture on and it cycles through all 4 levels starting at the lowest level, each level for 8 sec
8. The levels repeat 4 times. That is: Level 1,2,3,4,1,2,3,4,1,2,3,4,1,2,3,4 (1 is 50%, 4 is 100%). This takes 16 times 8 seconds or about 2 min
9. When it gets to the level you want to set the fixture(s) to, turn the wall switch off as soon as it gets to the level you want
10. If the fixture is not turned off during one of these 16 levels that are cycling, the LED Level Set module returns to original level before programming was started

This completes the configuration. When powered on, the fixture turns on at the selected level. This procedure can be repeated any time to change the selected level.

Limited Warranty: Seller warrants this product, if used in accordance with all applicable instructions, to be free from original defects in materials and workmanship for a period of five years from the date of purchase. Refer to the warranty information on the LDS website (www.LDSDimming.com) for exact details.
