

The VXR-1000 Series is designed to provide extended handheld coverage by repeating transmissions in both directions through an existing high power mobile radio.

Reliability is assured by a highly integrated surface mount circuit design and a aluminum extrusion chassis. Important channel frequency data is stored in EEPROM, and is easily programmable by dealers using a personal computer and the Vertex VPL-1 Programming Cable and CE-22 Software.

Please take a few minutes to read this manual carefully. The information presented here will allow you to derive maximum performance from your VXR-1000. After reading it, keep the manual handy for quick reference, in case questions arise later on.

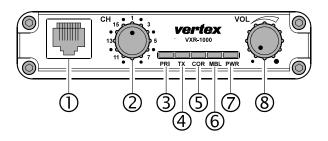

We're glad you joined the Vertex team. Call on us any time, because our business is communications. Let us help you get your message across.

CONTROLS & CONNECTORS

Rear Panel

Front Panel

① Microphone Jack

Connect the microphone plug to this jack.

② CHANNEL Selector Knob

This knob selects the operating channel.

③ PRI Indicator

When on, "**PRI**" indicates that the unit is at priority count zero and will repeat all transmissions.

④ TX Indicator

When on, "TX" indicates that the repeater is transmitting to the handheld.

⑤ COR Indicator

This lamp *blinks* red when the VXR-1000 is receiving a signal from a handheld, and *glows* red while the VXR-1000 is receiving a sub-audible tone from the handheld.

6 MBL Indicator

This lamp *blinks* red when the Mobile is receiving signal from repeater or base, and glows red while the Mobile is transmitting to the repeater or base.

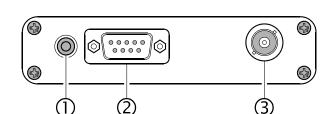

⑦ PWR Indicator

This is the main "Power ON" indicator for the VXR-1000.

8 VOLUME Knob

This knob adjusts the receiver volume.

Error Message		
No Channel Data (Operating Channel is Vacant)	TX, COR, and PW R Indicators Blink	
ARTS Out of Range	PWR Indicator Blinks	

① EXT SP (External Speaker)

An external loudspeaker may be connected to this 2-contact, 3.5-mm mini-phone jack.

② DSUB 9-Pin Accessory Connector

External TX audio line-input, PTT, external RX audio line-output, and other signals may be obtained from this connector for use with accessories.

Pin Assignments		Pin 1	GND
Pin 2	Mobile Transmit Audio	Pin 3	Power Supply Control
Pin 4	Mobile PTT Output	Pin 5	Vcc (13.8V DC)
Pin 6	Mobile Receive Audio	Pin 7	Mobile COR Detect
Mahila Migraphana		Mobile TX	
Pin 8	Pin 8 Mobile Microphone	Pin 9	Detect/Mobile
	Audio		Microphone PTT

③ Antenna Socket

The Antenna socket is a standard 50 Ω BNC antenna connector.

HARDWARE SETTINGS

- **JP1004**: Controls the output impedance of the transmit audio line to the mobile radio. Short: low-Z (600 Ω); open: high-Z (4.7 k Ω) *
- **JP1005**: Controls the maximum drive level of the transmit audio output to the mobile.

Short: low level output (0-100 mV)*; open: high level output (0-5 V).

JP1001/1002/1003:

Polarity of Power supply control. Default setting: active high (JP1003: short).

- VR1001: Mobile Microphone level
- VR1002: Mobile RX Audio (External Modulation level)
- VR1007:Mobile TX Audio (output level) * default setting

The VXR-1000 has a fixed 3 minute time-out timer for base to handheld transmissions. If the mobile COR is active for more than 3 minutes it will send a error blip and cease transmission until the mobile COR is inactive.

FUNCTIONAL DESCRIPTION

When the user leaves the vehicle, they activate their mobile radio via its front panel or a separate switch. When the mobile radio is receiving a signal, the VXR-1000 will begin transmitting on the hand-held's receive frequency. The user is able to hear and respond to all radio traffic, including other hand-helds on the same frequency. The repeater jumpers and potentiometers are custom-configured for use with the particular mobile radio to which it will be connected. The CE-22 software is used to program the repeater for the required operating parameters.

Operating Manual Reprint

TRUNKING OPERATION

When the radio is connected to a trunking mobile you wish to access the system from your handheld radio, key the handheld briefly then release the PTT key. The radio will attempt to acquire a voice channel on the trunking system by keying the mobile for 200 mS and monitoring the "on-air detect" line from the mobile. If the VXR-1000 does not see the radio transmit at all (system is busy), it will send a low tone to the handheld to alert you that the system is busy. The radio will automatically retry every 5 seconds and send a "busy" tone to the handheld with each unsuccessful attempt, to indicate progress of the call attempt. If unsuccessful after 30 seconds, the radio will transmit an "intercept" tone to alert the handheld that the call attempt failed.

When the VXR-1000 detects that the mobile is transmitting, it will continue to monitor the "onair detect" line until the transmitter remains keyed for at least 250 mS to determine if the radio is merely handshaking or retrying. After successful acquisition of a voice channel, it will continue to hold the mobile's PTT active for 2 seconds and transmit a "go-ahead" blip to the handheld. You may then key their handheld to speak on the voice channel. If you do not key up within the 2-second period, the radio will unkey the mobile and send the "intercept" tone, as before.

Specifications

GENERAL	
Frequency Range:	150 - 174 MHz
	(Receive frequencies within a ± 5 MHz spread over the range 150 - 174

Maximum Deviation:	±5 kHz/2.5 kHz
Conducted Spurious Emissions :	-60 dBc
FM Hum and Noise:	-40 dB

Specifications may be subject to change without notice or obligation.

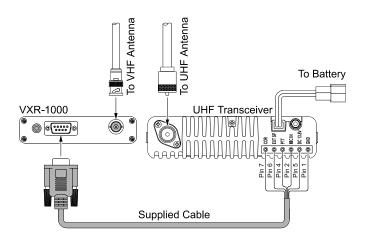

The VXR-1000 must only be installed in vehicles having a negative ground electrical system. Mount the transceiver where the Indicators, controls, and microphone are easily accessible, using the supplied mounting bracket. The VXR-1000 may be installed in any position, but should not be positioned near a heating vent nor anywhere where it might interfere with driving (either visually or mechanically).

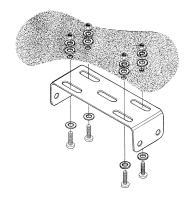

VXR-1000 Installation

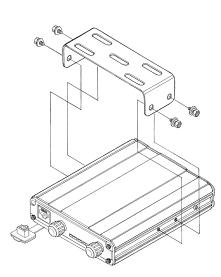

- □ Choose a mounting location with sufficient clearance for the VXR-1000, plus space for ventilation around the cooling fan and above and below the VXR-1000. Using the mounting bracket as a template for the mounting holes, use a 4.8 mm (3/16") bit to drill the mounting holes, and secure the mounting bracket with the supplied screws, washers, and nuts (see diagram).
- Position the VXR-1000 in the bracket so that the holes in the side are aligned with those in the bracket, and bolt the VXR-1000 into place using the supplied short screws and flat washers.

VXR-1000 Connections

The VXR-1000 provides a convenient rear-panel Accessory Connector for easy connections to your transceiver. The connections to this jack are in accordance with a standard adopted by many commercial radio. However, we recommend that you verify the connections to any cable you already own by comparison to the pictorial below.

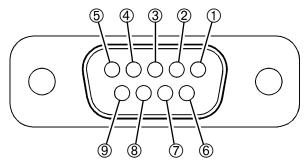

Installations

VXR-1000 Connections

Pin 1: GND

Signal Ground

Pin 2: Mobile Transmit Audio

Receive audio output from the VXR-1000, passed to the MIC jack of the mobile transceiver.

Output impedance can be changed via jumper JP1004. open: 4.7 k Ω , short: 600 Ω (default: open).

Output level can be changed via jumper JP1005 (range) and VR1007 (value).

open: -15 ~ +7 dBm, short: -40 ~ -15 dBm (default: short). Frequency response (pre-emphasis on/off) can be changed via CE-22 software (default: off).

Pin 3: Power Supply Control

The polarity of the "Power Supply Control" line can be changed via jumpers JP1001/1002/1003.

high: 3 ~ 16 V

JP1001	J1002	J1003	Function
short	short	open	VXR-1000 turns on when
SHOT	SHOL	open	this pin connects to ground.
short	open	short	VXR-1000 turns off when
311011	open	31011	this pin connects to ground.
open	short	open	VXR-1000 turns off when
open	311011	open	this pin is "high" level.
open	open	short	VXR-1000 turn on when this
open	open	Short	pin is "high" level.

Pin 4: Mobile PTT Output

This pin controls the mobile transceiver's TX/RX status. This pin is an open-collector, "active-low" circuit. When this pin closes to ground,

the mobile transceiver is switched into the TRANSMIT mode. Maximum current: <20 mA.

Pin 5: Vcc (13.8 V)

This pin is the DC power supply connection for the VXR-1000.

Maximum current: 2A.

Pin 6: Mobile Receive Audio

Receiver audio input to the VXR-1000 from the mobile transceiver.

Input impedance: 100 k Ω

The input level can be changed via CE-22 (range) and VR1002 (value).

CE-22 EXT MOD level "HIGH": -18 dBm ~ -2 dBm CE-22 EXT MOD level "LOW": -36 dBm ~ -18 dBm Frequency response (de-emphasis on/off) can be changed via CE-22 (default: off).

Pin 7: Mobile COR Detect

Squelch control input (including the effect of a CTCSS or DCS detected tone) or audio mute line, also known as a "Busy" line.

When this pin is at "high" level (mobile radio Squelch *open*), the VXR-1000 is commanded into the TRANSMIT mode.

Squelch open: 3 V, Squelch closed: 0 V.

Squelch open: >3 V, Squelch closed: 0 V.

This input level can be switched between "Squelch open" and "Squelch closed" when this pin is at "high" level via CE-22.

Impedance: 1 MΩ.

The Squelch Threshold level can be changed by adjustment of VR1003.

Pin 8: Mobile Microphone Audio

Mobile microphone audio input. This is the same audio which is being sent to the mobile radio's Mic Amp circuit (i.e. the microphone's audio is "split" between the mobile radio and the VXR-1000)

Input impedance: $100 \text{ k}\Omega$

The input level to the mobile transceiver can be changed via CE-22 (range) and VR1001 (value).

CE-22 EXT MIC level "HIGH": –18 dBm ~ 0 dBm CE-22 EXT MIC level "LOW": –44 dBm ~ –18 dBm

Pin 9: Mobile TX detect/Mobile Microphone PTT

Mobile Tx/Rx control input.

This input function can be switched between "Mobile MIC PTT" input and "Mobile Tx Detect" line input via CE-22. This input level can be switched between "Tx" and "Rx" when this pin is at "high" level via CE-22.

Input impedance: 10 kΩ.

Note:, When the VXR-1000 is used in a Trunking system, the "Mobile TX Detect" input signal must be received from the mobile transceiver when connected to the Trunking system (the VXR-1000 checks this pin's level to confirm successful connection to the trunking system). When this pin is at "high" level (>3 V), the VXR-1000 is commanded into the TRANSMIT mode. When a successful "handshake" occurs with the Trunking system, this line goes "low" and the VXR-1000 is released into the RECEIVE mode.

Interconnection with Vertex VX- Series Transceivers

This document outlines the interconnections and hardware settings required for interface of the Vertex VXR-1000 Compact Mobile Repeater to the Vertex VX- series of mobile transceivers.

1. Interconnections to Mobile Transceivers

The chart below shows the interconnections between J1004 on the VXR-1000 and the corresponding interface jacks on the compatible mobile transceivers.

VXR-1	1000 DSUP 9-pin Accessory Connector	FTL-7	011	VX-20	000	VX- 3 0	00
Pin 1	GND	Pin 8 of J 2006	GND	Pin 5 of J1003	GND	Pin 5 of J1004	GND

	necting to Pin 9 of J1004)
Pre-emphasis:	Off
De-emphasis:	On
EXT MIC Level:	Low
EXT MOD Level:	Low

5.Alignment

5-1: VXR-1000 Deviation Setting

On the connected mobile transceiver, receive a signal from an external signal source with 1 kHz modulation frequency and deviation level of ±3.0 kHz (±1.5 kHz for the "Narrow" mode).

This signal, when passed from the connected mobile transceiver to the VXR-1000, should produced a transmitted signal from the VXR-1000 with 1 kHz deviation at not less than ±3.0 kHz (±1.5 kHz for the "Narrow" mode).

If the deviation level from the VXR-1000 is not correct, adjust VR1002 (inside the VXR-

1000) for an output deviation of ±3.0 kHz (±1.5 kHz in the "Narrow" mode).

5-2: VXR-1000 Receiver Output Level Setting

When the VXR-1000 receives a signal from an external signal source (on the uplink frequency used by the portable transceiver) modulated at 1 kHz at a level of ±3.0 kHz (±1.5 kHz in the "Narrow" mode"), the output passed to the connected mobile transceiver should produce a transmitted output signal from the mobile at a level of ±3.0 kHz (±1.5 kHz in the "Narrow" mode").

If the output level to the mobile does not produce correct deviation from the mobile, adjust VR1007 (inside the VXR-1000) so that the transmitted output from the mobile is modulated at a level of ±3.0 kHz (±1.5 kHz in the "Narrow" mode").

6. Trunking System configuration

All trunking parameters depend on the configuration of the individual trunking system in which the connected mobile transceiver is used. Please consult the CE22 programming instructions, and the separate "VX-1000R Trunking Interface Manual," for information about the software and other settings for the VXR-1000 when integrated into a trunking environment.

7. Miscellaneous

In order to improve the audio muting performance of the VX-3000, a minor circuit change was adopted from Production Lot #03 (VX-3000L/U) and 04 (VX-3000V), and this change was reflected in CE-19 software version 1.16. This change affects the connection point for the Squelch (Mobile COR Detect) line, and the connection point is identified as "AF MUTE• in the various documentation for the VX-3000.

The configuration version can be identified by looking for the presence of a jumper connection at jumper pad JP1002 in the VX-3000U, or JP1016 in the VX-3000L. The connections for the Mobile COR Detect line should be made as follows:

Interconnection with Vertex VX- Series Transceivers

VX-3000U

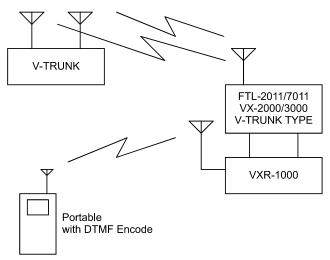

If JP1002 is not jumpered, connect this line to Pin 8 of Q1043. If JP1002 is jumpered, connect the Mobile COR Detect line to JP1002. VX-3000L

If JP1016 is not jumpered, connect this line to Pin 8 of Q1043. If JP1016 is jumpered, connect the Mobile COR Detect line to JP1016.

VXR-1000 Trunking Interface Manual

This document outlines the interconnections and hardware settings required for interface of the Vertex VXR-1000 Compact Mobile Repeater to the Vertex VX- series of mobile transceivers in a trunked environment (using the Vertex VX-Trunk System).

The illustration below outlines the basic configuration of a VX-Trunk system, using the VXR-1000 as a range extender for a portable transceiver.

1. Equipment Required

Portable Transceiver: Must have a DTMF Encoder installed. Mobile Transceiver: Must be configured for operation within VX-Trunk System. Compatible models include FTL-7011, VX-2000, and VX-3000. Please refer to the VX-Trunk System documentation for configuration details for the mobile transceiver.

 2. INTERCONNECTIONS FROM VXR-1000 TO MOBILE TRANSCEIVERS

3. VXR-1000 CONFIGURATION

For operation in a VX-Trunk II environment, note the following setup tips regarding the VXR-1000 (set via the CE-22 software):

- The VXR-1000's "Pri Timer" option must be set to a non-zero value by CE-22).
- In CE-22, set the TRUNKING mode to OFF (for VX-Trunk II only; for other Trunking systems like LTR, this parameter must be set to ON).
- O Set PTT1 to HIGH.
- O Other parameters such as Master/Slave and Sub_Audio may be set via CE-22 per the customer's operating requirements.

4. VX-TRUNK System Operating

Example

4-1: Making a Call from the Portable

- 1. Press the portable's PTT key for longer than the "Sampling Time" of the VXR-1000, so as to ensure that the VXR-1000 receives the portable's signal, then press "3 *" while transmitting to connect to the VX-Trunk II system.
- 2. When the "3 *" is completed, immediately release the portable's PTT key, so as to return the portable to the receive mode.
- 3. If the VX-Trunk system receives the connection command, a double "beep" will be heard from the portable's speaker.
- 4. Press the portable's PTT key for longer than the "Sampling Time" of the VXR-1000, so as to ensure that the VXR-1000 receives the portable's signal, and enter the other unit's 5-digit subscriber number via the portable's DTMF pad. Now release the portable's PTT key to return the portable to the receive mode.
- 5. When the subscriber number is successfully received by the VX-Trunk II system, and a connection thereby initiated, the VX-Trunk II system will respond, and a double "beep" will be heard from the speaker of the portable.

4-2: Receiving a Call at the Portable

- 1. When the mobile connected to the VXR-1000 receives a connection request from the VX-Trunk II system, it relays a "connection tone" to the portable. When this happens, press the PTT key on the portable.
- 2. Hold in the PTT key on the portable longer than the "Sampling Time" programmed for the VXR-1000, then press the DTMF "*" key. After pressing the "*" key, release the PTT key on the portable.
- 3. When the VX-Trunk II system receives the "*" response from the portable, it will respond, and a double "beep" will be heard from the speaker of the portable.
- 4-3: Terminating a Call from the Portable
- 1. Press the portable's PTT key.
- 2. Hold the portable's PTT key for longer than the "Sampling Time" of the VXR-1000, then press the "#" key. The call will now be terminated, and you may release the portable's PTT key.

12

VXR-1000 Trunking Interface Manual

5. Notes Re Trunking Operation

5-1:

The VX-Trunk II system operates in a full duplex mode.

In this environment, while a call is in progress, the connected mobile passes the received audio through to the VXR-1000 for re-transmission to the portable. In order for the portable to be able to "capture" the VXR-1000 to make a transmission back to the other party, the VXR-1000 must be set, via the CE-22 software, for a "Priority Timer" setting (Pri Timer) which is not zero. A very short time will allow quick interruption, but the incoming message from the VXR-1000 to the portable may sound "choppy" due to the frequent interrupts.

When the portable transmits longer than the "Priority Timer" setting, the VXR-1000 will interrupt its transmission, and the VXR-1000 will instantly switch to the "receive" mode on the portable's transmitting frequency.

5-2: VXR-1000 Local Microphone

In order to facilitate the above sampling feature, it is not possible to use a "Local" mic (a DTMF microphone attached to the VXR-1000) for access to the VX-Trunk II system.

CE-22 Program Software

The Vertex CE-22 program is a software package which controls the VXR-1000's "Clone Edit" feature. This manual outlines the installation and use of the CE-22 software when used with the VXR-1000.

1. CE-22 Installation

and Operating Modes

The Vertex CE-22 program is an integrated software package designed to work with IBM PC, XT, AT, or compatible computers. In order for CE-22 to run properly, your computer must run DOS v3.0 (or a later version).

1-1: CE-22 Installation

There is no installation software included with your distribution diskette.

Use standard DOS procedures to install the software on your hard drive.

For example, let us create a directory named "Vertex" into which we shall install the CE-22 software. First, make a copy of the distribution diskette, then use the archive copy for the installation from (floppy) Drive A:

> c:\ mkdir vertex [ENTER] c:\ cd\vertex [ENTER] c:\vertex copy a:*.* [ENTER]

The files on the archive floppy disk will now be copied to your hard drive into the new "vertex" directory.

1-2: Starting CE-22

Before starting the CE-22 program, connect the VPL-1 Cloning Cable between your computer's COM port and the VXR-1000's MIC jack.

Connecting the VPL-1 cable automatically initiates the "CLONE" (programming) mode, and the PWR LED will blink while the CLONE mode is active.

If your computer has more than one COM port, you may select the COM port to be used via the "Common Data" window (accessed by pressing F2 after CE-22 is started). Either COM1 or COM2 may be utilized.

To start CE-22, be sure your computer screen is displaying the DOS prompt. The procedure thereafter is: c:\ ce22 [ENTER]

The CE-22 program will now start. After five seconds in an initial Program Identification screen, the software will automatically switch to the main Channel Editing Screen.

1-3: Startup Options

Two mode options for CE-22 are available.

The standard ce22 command allows all normally-required channel data entry parameters to be entered and/or edited. Additionally, the COM port line in the "Common Data" window may also be changed. However, other "Common Data" parameters cannot be changed, although they are visible in the window.

The alternative ce22 /p option allows editing of the other parameters in the "Common Data" window. While changes to these parameters are not normally required, major system changes may necessitate modification of one or more "Common Data" items. If this is the case, type ce22 /p [ENTER] instead of (only) ce22 [ENTER] when starting the program.

2. Sending/Downloading Data from the VXR-1000

2-1: Reading Data from VXR-1000

When you start up CE-22, it is often useful to download the current channel information from the VXR-1000 for archive purposes.

To do this, press F5. The current data will be read by the computer, and the data will appear on the screen. If you wish to save this data to disk, press F4 and assign a file name into which the archive data will be saved.

2-2: Loading Data to VXR-1000

When all channel data has been successfully set up, press F6 to send the channel data to the VXR-1000.

2-3: Saving Data to Disk

Channel programming data may be saved to your computer's hard drive, or to a floppy diskette, by use of the F4 command. You will be prompted to define a file name to be used. Standard DOS file name specifications should be used (e.g. no more than eight characters in the file name).

If you wish to create a separate sub-directory (so as to store files for different customers in different sub-directories, for example), press [Tab], then press [F3], to activate the [Mk Dir] (Make Directory) function. You can then type in the name you wish to use for this sub-directory, then continue with the file storage process.

2-4: Printing Hard Copy

To print a copy of the currently-displayed channel data file, press [F7] when all programming steps have been completed. This allows you to attach a copy of the programming information to the programming work order, for the convenience of the customer.

3. Programming Navigation/ Use of SPACE Key

When CE-22 is initially started with a new VXR-1000, only CHANNEL 1 will be showing.

Use the UP and DOWN keys to navigate to different channel numbers. Use the LEFT and RIGHT keys to navigate between the various columns of a particular channel programming line. Beginning in Section 4 of this manual, we will only discuss a single line of channel programming data, as each line of channel programming data is identical (except for the fact that CHANNEL 1's data cannot be hidden).

3-1: Hiding/Un-hiding Channel Data using SPACE Bar

The SPACE bar is used in many programming steps to activate or de-activate a particular function.

If the cursor is on the channel number column, however, pressing the SPACE bar will toggle between hiding of that channel number's data and re-activating that channel number's data. CHANNEL 1's data, however, cannot be hidden.

CE-22 Program Software

A channel number on which data has been hidden will display "-- --" in place of the field entries. On the VXR-1000, if you select a "hidden" channel, three indicators will blink to alert you to this fact.

If you make a change to the programming of a "hidden" channel at a later time, the channel will automatically be re-activated (removed from "hidden" status). You will need to return to the Rx Freq field in order to re-hide it.

3-2: Primary Use for SPACE Bar

In many programming steps, such as CTC-SS or DCS tone/code entry, an initial press of the SPACE bar will activate the parameter (turn it on) or de-activate the parameter (turn it off). In each such step, you will be prompted in the upper-right-hand window as to additional steps to be taken to secure the final value for the parameter you are currently setting.

In programming steps where a numerical value is required, press the [Space] bar to increase the value, or [Back Space] to decrease the value.

4. Channel Frequency Programming 4-1: Rx Freq.

(Edit Receive (or Simplex) Frequency)

Use the 0 - 9 keys to enter the desired channel frequency directly, and press [ENTER]. The frequency entered will be adjusted automatically if it does not conform to the "CHANNEL STEP" parameter, and will be adjusted to the nearest "valid" step; the frequency will also appear in the Tx Freq. field (next step) automatically, to simplify entry if the current channel is to be used on Simplex. You do not need to enter all eight digits of the frequency; empty digits to the right will be set to "0" when you press [ENTER]. Pressing [.] ("period") after several digits forces those digits to be "MHz" digits. If you press [.] before entering any digits, only the "kHz" digits will be changed.

Pressing only the SPACE bar, without entering any frequency digits, toggles the data for the entire channel between "hidden" and

CE-22 Program Software

"active" status (except for CHANNEL 1, which cannot be hidden).

Hidden channels will show "-- --" in place of the various field entries, and they are not available for operation. However, they are still stored in "hidden" form for possible recall later.

Note: Any entries or changes made to the Rx Freq. field will also be applied to the Tx Freq. field, so you may need to edit that field after making any changes here.

4-2: Tx Freq. (Edit Transmit Frequency)

Use the 0 - 9 keys to enter the desired channel frequency directly, and press [ENTER]. The frequency entered will be adjusted automatically if it does not conform to the "CHANNEL STEP" parameter, and will be adjusted to the nearest "valid" step. You do not need to enter all eight digits of the frequency; empty digits to the right will be set to "0" when you press [ENTER]. Pressing [.] ("period") after several digits forces those digits to be "MHz" digits. If you press [.] before entering any digits, only the "kHz" digits will be changed.

Note: The Transmit Frequency is automatically copied from the Receive Frequency's column, so any changes you have made to the Tx Freq. field will be LOST if the Rx Freq. field is modified. Therefore, you should set the Rx Freq. field data first, then edit the Tx Freq. field.

5. CTCSS/DCS Decoders and Encoders

5-1: CTCSS Decoder

(Toggles CTCSS Decoder ON/OFF, Sets CTCSS Freq.) Press the SPACE bar to toggle the CTCSS Decoder ON or OFF, or press [ENTER] to display the TONE SELECT window, from which you may select a CTCSS frequency using the Arrow keys; press [ENTER] again to accept the selected tone, or press [ESC] to cancel.

If you know the CTCSS frequency you want (the precise value), you can enter it directly using the 0 - 9 keys and the [.] ("period") key.

When the desired CTCSS frequency is dis-

played, press [ENTER] to accept this value. If you keyed in an invalid frequency (not among the "standard" CTCSS tone list), the TONE SELECT window will appear, with the nearest valid CTCSS frequency pre-selected.

Turning CTCSS ON turns DCS OFF (since both cannot be ON). CTCSS cannot be selected for use if ARTS is enabled (ARTS uses DCS only).

5-2: DCS Decoder

(Toggles DCS Decoder ON/OFF, Sets DCS Code #) Press the SPACE bar to toggle the DCS Decoder ON or OFF, or press [ENTER] to display the CODE SELECT window, from which you may select a DCS code using the Arrow keys; press [ENTER] again to accept the selected code, or press [ESC] to cancel.

If you know the three-digit DCS code you want, you can enter it directly using the 0 -9 keys. When the desired DCS code is displayed, press [ENTER] to accept this value.

If you keyed in an invalid code number (not among the "standard" DCS code list), the CODE SELECT window will appear, with the nearest valid DCS code number pre-selected.

Turning the DCS Decoder ON turns CTC-SS OFF (since both cannot be ON). DCS Encode and Decode are both required for ARTS operation.

5-3: CTCSS Encoder

(Toggles CTCSS Encoder ON/OFF, Sets CTCSS Freq.) Press the SPACE bar to toggle the CTCSS Encoder ON or OFF, or press [ENTER] to display the TONE SELECT window, from which you may select a CTCSS frequency using the Arrow keys; press [ENTER] again to accept the selected tone, or press [ESC] to cancel.

If you know the CTCSS frequency you want (the precise value), you can enter it directly using the 0 - 9 keys and the [.] ("period") key.

When the desired CTCSS frequency is displayed, press [ENTER] to accept this value. If you keyed in an invalid frequency (not among the "standard" CTCSS tone list), the TONE SELECT window will appear, with the nearest valid CTCSS frequency pre-selected.

Turning CTCSS ON turns DCS OFF (since both cannot be ON). CTCSS cannot be selected for use if ARTS is enabled (ARTS uses DCS only).

Note: Turning on the CTCSS Encoder automatically turns off the DCS Encoder, if it was on.

5-4: DCS Encoder

(Toggles DCS Encoder ON/OFF, Sets DCS Code #) Press the SPACE bar to toggle the DCS Encoder ON or OFF, or press [ENTER] to display the CODE SELECT window, if you are not viewing it already); press [ENTER] again to accept the selected code, or press [ESC] to cancel.

If you know the three-digit DCS code you want, you can enter it directly using the 0 - 9 keys. When the desired DCS code is displayed, press [ENTER] to accept this value.

If you keyed in an invalid code number (not among the "standard" DCS code list), the CODE SELECT window will appear, with the nearest valid DCS code number pre-selected.

Turning the DCS Encoder ON turns CTCSS OFF (since both cannot be ON). DCS Encode and Decode are both required for ARTS operation.

6. ARTS (Automatic Range Transponder System) Operation

The ARTS feature causes the VXR-1000 to "shake hands" electronically with the user's ARTS-compatible portable transceiver. If the portable fails to shake hands with the VXR-1000 in two successive handshake cycles, the PWR lamp will begin blinking, so as to indicate "Out of Range" status for the portable.

ARTS operation requires that DCS Encode and Decode be engaged. It will not function using CTCSS nor carrier-only squelch. The portable radio's ARTS Mode must be in complement in order for ARTS to function correctly.

6-1: ARTS Mode

ARTS operates in one of four modes, described below:

OFF: ARTS is not active on this channel. No handshaking is performed.

- **RX**: The VXR-1000 receives handshake signals from the portable, but does not send handshake signals itself. If an outof-range condition occurs, the VXR-1000 will indicate "Out-of-Range" locally, but the portable user will not receive an "Out-of-Range" warning.
- **TX**: The VXR-1000 sends out handshake signals, but does not act on handshake signals received. If an out-of-range condition occurs, the portable user will receive an "Out-of-Range" warning (if the portable is properly programmed), but the VXR-1000 will not indicate an out-of-range condition locally.
- **TRX**:Both the TX and RX functions described above are active.

Press the SPACE bar to select the desired ARTS Mode.

6-2: ARTS Int (Interval)

The ARTS Interval is the amount of time between ARTS handshake transmissions issued by the VXR-1000. Two selections are available: 25 seconds or 55 seconds. The portable radio's ARTS Interval setting must match that of the VXR-1000 in order for ARTS to function correctly.

Press the SPACE bar to select the desired ARTS Interval.

7. DCS Type (Normal/Inverted)

7-1: DCS Type

This command is effective only when DCS is chosen for squelch control.

A = "Normal" DCS

B = "Inverted" (complement) DCS

Press the SPACE bar to select the desired DCS Type.

CE-22 Program Software

7-2: DDec Type (DCS Decoder Type)

This command selects the manner in which DCS is to be decoded.

- **Fixed** = Decodes the type selected in 7-1 only (Normal or Inverted).
- Auto = Decodes both types (Normal and Inverted)

Press the SPACE bar to select the desired DCS Decoder Mode.

8. Squelch

8-1: Sql Ofst (Squelch Offset)

The Squelch Offset function provides a means to fine-tune the VXR-1000 squelch level on a channel-by-channel basis, with-out having to perform a full alignment.

The available values are an arbitrary scale of 0 to 255. Use the Space bar and the Backspace key to increment/decrement the Squelch Offset level.

Note: Although the Squelch Offset range is between 0 and 255, the squelch threshold will be close to saturation if the value is set to about 100 or above. Therefore, you will observe no significant difference in squelch threshold between the values of 100 and 255.

9. Encryption

9-1: Encryption

When ON, the VXR-1000 operates in the "Encrypted' mode on this channel. The encryption type is compatible with the encryption system used in the Vertex VX-10 (FTT-15 module), VX-200 (FSU-1083), VX-400 (FVP-25), and the VX-500/510 (FVP-22) models.

Press the SPACE bar to toggle Encryption ON and OFF.

10. Channel Spacing

10-1: W/N (Wide/Narrow Channel Spacing)

This function selects the channel spacing environment in which the VXR-1000 operates.

- Wide = 25 kHz Channel Spacing, ±5 kHz Deviation
- **Narrow** = 12.5 kHz Channel Spacing, ±2.5 kHz Deviation

Press the SPACE bar to select the desired channel spacing environment.

11. Input Modulation

11-1: Mod In (Input Modulation Selection)

This function selects how the VXR-1000 will utilize and apply audio signals which are to be transmitted to the associated portable radio.

- Mix: Any audio being transmitted by the microphone on the mobile radio connected to the VXR-1000 will also be transmitted to the portable on the other band. If a second microphone is connected directly to the VXR-1000 and is also keyed simultaneously with the microphone of the mobile, the audio from both microphones will be mixed and transmitted to the portable.
- **Mono**: The VXR-1000 will only select audio from the microphone which first had its PTT key pushed. Audio from the other microphone, if its PTT key is pushed while the first microphone remains keyed, will be ignored.

12. Mobile Monitoring

12-1: MBL Moni (Mobile Audio Monitoring)

This command determines whether or not the receive audio from the connected mobile radio will be routed to the VXR-1000's EXTERNAL SPEAKER jack.

Press the SPACE bar to toggle the audio between ON and OFF.

13. Transmitter Power

13-1: Tx Pwr

(Transmitter Power Output Selection)

This command selects the desired power output from the VXR-1000 on the current channel. The available values are 0.5, 1.0, 2.5, and 5.0 Watts.

Press the SPACE bar and the Backspace key to increment/decrement the Transmit Power Level.

14. Trunking Operation

14-1: Trunking

This command activates or de-activates the intercommunication protocol for Trunking operation with the connected mobile radio.

If the mobile radio is a conventional twoway radio, this function must be set to OFF.

If the mobile radio is a trunked radio (Smar-Trunk, LTR, etc.), this function should be set ON. Also, set the Trunking Data parameters in the "Common Data" window as appropriate for operation with the mobile radio. Consult the Service Manuals for the VXR-1000 and the trunked mobile radio to determine the proper settings.

Press the SPACE bar to toggle Trunking operation ON or OFF.

15. Courtesy Blip

15-1: Cour Blip (Courtesy Blip)

When ON, this function causes the VXR-1000 to send out a "blip" on the portable radio frequency each time the portable radio is unkeyed. This provides audible confirmation to the user that the VXR-1000 was able to receive the transmission from the portable.

This "blip" is not transmitted by the connected mobile radio.

Press the SPACE bar to toggle the Courtesy Blip ON and OFF.

16. MBL MIC

(Mobile Microphone Configuration)

This command affects the way in which Pin 9 of J1004 (DSUB 9-pin Jack on rear of VXR-1000) responds to PTT commands.

16-1: Conventional Mode

If the VXR-1000 and mobile radio are used in a "conventional" two-way radio environment (the Trunking command in section 14 set to OFF), the MBL MIC command selects whether or not the VXR-1000 will transmit together with the mobile radio when the mobile's PTT switch is keyed. If this command is set to ON, the VXR-1000 will trans-

CE-22 Program Software

mit in tandem with the mobile radio when the mobile microphone's PTT switch is pressed. If this command is set to OFF, the VXR-1000 will not transmit when the mobile microphone's PTT switch is pressed.

Press the Space bar to toggle this setting to ON or OFF, as needed.

16-2: Trunking Mode

If the VXR-1000 is used in a Trunking environment (with the Trunking command in section 14 set to ON), please set the MBL MIC command to ON. This setting allows the "Mobile TX Detect" line to signal the VXR-1000 when the mobile radio is transmitting, whether by local microphone command or by trunking system handshake command.

Press the Space bar to toggle this setting to ON.

17. Microphone Control

17-1: MIC Cntl

(VXR-1000 Microphone Utilization)

This function selects which radio (VXR-1000 and/or mobile) will transmit audio from the microphone connected to the VXR-1000.

- Int: The VXR-1000 microphone will only cause transmission on the VXR-1000 to the portable radio. It will not cause transmission on the connected mobile radio.
- Ext: The VXR-1000 microphone will only cause transmission on the connected mobile radio. It will not cause transmission on the VXR-1000 to the portable. Pin 4 of J1004 (on the VXR-1000) will go "Active Low" to provide a PTT output to the mobile radio.
- **Both**: The microphone connected to the VXR-1000 will cause transmission on both the VXR-1000 and the mobile.

Pin 4 of J1004 (on the VXR-1000) will go "Active Low" to provide a PTT output to the mobile radio.

Press the Space bar to select the desired mode of operation.

CE-22 Program Software

18. External Radio Control

18-1: EXT.R Cntl

This command selects the manner in which the VXR-1000 will control (and be controlled by) the connected mobile radio.

- **On**: Signals received by the mobile radio will be re-transmitted to the portable radio AND signals received from the portable radio will be re-transmitted by the mobile radio.
- **RX**: Signals received by the mobile radio will be re-transmitted to the portable radio, but signals from the portable radio WILL NOT be re-transmitted by the mobile radio.
- **Off:** Signals will not be re-transmitted by the VXR-1000 or mobile radio in either direction.

Press the Space bar to toggle this command function to ON, RX, or OFF.

19. Priority Timer

19-1: Pri Timer (Priority Timer Polling Interval) The function sets the interval which separates the momentary polling (by the VXR-1000) of the portable radio; the VXR-1000 will unkey its transmitter, listening for a possible transmission from the portable, and if a transmission is detected, the VXR-1000 will cease its transmission. The VXR-1000 will instantly key up the connected mobile radio to transmit to the "base." Therefore, this feature allows the portable radio user to override an incoming transmission from the "base," if desired.

The available settings are 0.25 second through 3.00 seconds. A setting of "0.00" seconds turns the interval timer off.

Use the Space bar or Backspace key to increment or decrement this setting, respectively.

20. Master/Slave Operation Parameters 20-1: Master Tone

When LkTn ("Lock Tone") is chosen as the Master/Slave Mode, the user has the option of using either 847.5 Hz or 832.5 Hz as the Master Tone. Press the Space bar to select the desired Master Tone.

Note: If the Master/Slave Mode setting is not set to LkTn, the Master Tone command will not be available.

20-2: Master/Slave Mode

This command determines how the VXR-1000 will behave when it is within the range of other VXR-1000s operating on the same frequency, such as when several mobile units are at a common location. One (and only one) VXR-1000 must act as the "Master" to provide portable-to-base relay for all portable units at the scene.

All other VXR-1000s that are present must revert to a "Slaved" (inactive) status, so as to avoid interference to each other.

Ordinarily, the first VXR-1000 arriving at a location will establish itself as the "Master" by periodically transmitting a Master Tone signal. Any other VXR-1000 coming within range will receive this tone (which is transmitted on the same frequency as that used by the portable for uplinking to the VXR-1000); these VXR-1000s, upon receiving the Master Tone, will switch themselves to the "Slaved" status.

If the original Master leaves the location, the first "Slave" VXR-1000 to detect the absence of the Master Tone will then transmit its own Master Tone. If not challenged by any other VXR-1000 within range, this Slave will then become the new Master for this location.

All of these transactions occur automatically, without interruption of voice communications occurring through the VXR-1000 system.

Use the Space bar to choose between the following selections:

- **YAESU**: This is a Yaesu/Vertex exclusive system, based on subaudible DCS signalling.
- **LkTn**: The Lock Tone system employs audible tone bursts for signalling.

CE-22 Program Software

Note: If the Yaesu system is used, you must program only CTCSS or Carrier Squelch to be used for the main coded squelch signal (for communication between the portable and the VXR-1000. The CE-22 will not allow the use of DCS if the Yaesu system is selected, because the Yaesu system needs to use DCS for coding for the Master Tone signal.

20-3: Master/Slave DCS

This function sets the DCS code to be employed by the Master VXR-1000. This DCS code is sent to other arriving VXR-1000s, whereby the first VXR-1000 on the scene announces itself as the Master.

Press [ENTER] to display the CODE SE-LECT window, from which you may select a DCS code using the Arrow keys; press [ENTER] again to accept the selected code, or press [ESC] to cancel.

If you know the three-digit DCS code you want, you can enter it directly using the 0 - 9 keys. When the desired DCS code is displayed, press [ENTER] to accept this value.

If you keyed in an invalid code number (not among the "standard" DCS code list), the CODE SELECT window will appear, with the nearest valid DCS code number pre-selected.

21. Modification of

"Common Data" Parameters

The following command parameters are found in the "Edit Common Data" window. These parameters are common to all channels in the VXR-1000 being programmed, unlike the previous command parameters (which can be set on a channel-by-channel basis).

21-1: PTT1 State

This command allows customization of the "Mobile COR Detect" signal at Pin 7 of J1004 (on the VXR-1000). This permits the VXR-1000 to work with either "Active High" or "Active Low" COR Detection signals from the mobile. **High**: If the connected mobile radio uses an "Active High" system, set the PTT1 State parameter to High.

Low: If the connected mobile radio uses an "Active Low" system, set the PTT1 State parameter to Low.

For control purposes, High is defined as 33.5 Volts, while "Low" is defined as ≤2.5 Volts.

There is no "pull up" facility provided on this connector pin.

21-2: PTT2 State

This command allows customization of the status of the "Mobile TX Detect" line applied to Pin 9 of J1004 on the VXR-1000. This allows either "Active High" or "Active Low" TX Detect signals from the connected mobile to be used.

- **High**: If the connected mobile radio's "TX Detect" line goes "High" during mobile transmission, set this parameter to High.
- Low: If the connected mobile radio's "TX Detect" line goes "Low" during mobile transmission, set this parameter to Low.

Levels used for this command are identical to those in section 21-1, and there likewise is no "pull-up" facility provided on this line.

21-3: Pre-Emphasis

When the VXR-1000 is receiving a signal from the portable radio, the received audio is fed to the connected mobile radio via Pin 2 of J1004 (on the VXR-1000). This parameter allows this audio signal to have either a flat response, or to have 6 dB/Octave preemphasis applied.

Off: No pre-emphasis will be applied.

On: Pre-emphasis will be applied to the signal applied to the connected mobile radio's modulator circuit.

If the connected mobile injects this audio signal to its modulator prior to the mobile's internal pre-emphasis network, please set this parameter to Off. If the audio input is applied downstream from the internal preemphasis network, please set this parameter to On.

21-4: De-Emphasis

The audio signal received by the connected mobile (received from the base station) is applied to the VXR-1000 via Pin 6 of J1004. This command allows de-emphasis to be applied (or not applied) to this audio signal, depending on the condition of the audio signal as it left the mobile radio's receiver section.

- **On**: De-emphasis of -6 dB/Octave will be applied to the incoming audio signal.
- Off: No de-emphasis will be applied to the incoming audio signal.

If the connected mobile applies de-emphasis to the audio prior to routing the audio to the VXR-1000, please set this parameter to Off. If the audio exits the mobile radio before de-emphasis is applied at the mobile radio side, please set this parameter to On.

21-5: EXT MIC Level

When audio from the connected mobile radio's microphone is routed to the VXR-1000 (via Pin 8 of J1004) for simultaneous transmission by the mobile and the VXR-1000, using the mobile's microphone as the audio source, this command allows configuration of the VXR-1000 so as to be compatible with the expected microphone audio level.

- **High**: The input level is between -18 dBm and 0 dBm.
- **Low**: The input level is between -44 dBm and -18 dBm.

21-6: EXT MOD Level

When receiver audio from the connected mobile radio is routed to the VXR-1000 (via Pin 6 of J1004), this command allows configuration of the VXR-1000 so as to be compatible with the expected receiver audio level.

- **High**: The receiver audio level is between 18 dBm and -2 dBm.
- **Low**: The receiver audio level is between-36 dBm and -18 dBm.

21-7: Band

This parameter must be set for the band on which the VXR-1000 is transmitting.

21-8: COM Port

Set this parameter for the COM port you will use for data uploading and downloading. Either COM1 or COM2 may be used.

21-9: Trunking Data

When the connected mobile radio is configured as a trunked radio, the VXR-1000's timing parameters must be compatible with those used in the trunking system in use. The default values are:

E-TX Time:	200 ms.
PTT2 Detector Time:	200 ms.
Connect Wait Time:	4800 ms.
Waiting Time:	2000 ms.

These parameters may be modified, if necessary, per the information presented below.

E-TX Time:

This is the length of the PTT signal sent to the trunked mobile in response to a connection request from the portable radio.

PTT2 Detect Time:

This is the length of the Mobile TX Detect response signal sent to the VXR-1000 from the trunked mobile in response to a successful trunking request.

Connect Wait Time:

This is the length of time which the trunked mobile will wait between connection requests to the trunking system.

Waiting Time:

When the trunking system has successfully initiated a connection with the connected mobile radio, the connection acknowledgment tone will be sent from the trunked mobile, via the VXR-1000, to the portable. The portable must then respond with its initial transmission within the time window set via this parameter, or else the connection to the trunking system will be terminated (to avoid tying up the system).

Try Counter:

This parameter sets the number of times that a connection attempt will be made by the mobile radio, after which the trunking connection attempt will terminate.

21-10: Master Interval

In the Master/Slave mode of operation, the interval between Master Tone polling transmissions can be set via this parameter.

Intervals between 120 seconds and 300 seconds may be selected.

Use the Space bar or Backspace key to increment or decrement this setting, respectively.

APPENDIX: Function Key Summaries

A: Channel Editing Window Function Keys [F1] Help

A comprehensive Help file provides stepby-step instructions for the field on which the cursor is currently located.

[F2] Common

Pressing [F2] allows viewing and/or editing of the COMMON DATA parameters. These are parameters shared by all channels.

[F3] Disk Load

This option allows you to load a previously-stored channel data file from your computer's hard drive (or from a floppy diskette). When loading from a floppy diskette, be sure to remember to include the drive name (either a:\ or b:\).

[F4] Disk Save

This option allows you to save the current screen's data to your hard drive or floppy diskette. You will be asked to define a file name and file path, just as you would if you were saving a word processing file, for example. When saving to a floppy diskette, be sure to remember to include the drive name (either a:\ or b:\).

[F5] Read ROM

This option is used to allow you to load currently-installed data from a VXR-1000 to your computer. This allows you to store the

CE-22 Program Software

current data as an archive before performing service work, etc., or to check a VXR-1000's data for possible programming errors.

[F6] Write ROM

When you have completed the programming steps for the VXR-1000 to be programmed, the Write ROM command is used to send the data from the computer to the radio.

Note that this command does not automatically save the data to your computer's hard drive (use the [F4] command for that purpose).

[F7] PrintOut

This command allows you to print the currently-displayed channel data, for paper-file or customer-copy purposes.

[F8] Quit

This command is used to exit from CE-22. As with many programs, you will be asked "Are You Sure?" before the "Quit" command is actually executed.

B: Function Keys within Each Function Key Group

This section will describe the features and capabilities of the [F] keys which appear when each of the function keys (described in section A above) is pressed.

B-1: Sub-Functions within [F2] (Common)

[F1] Help

This command provides a Help file for each available setting.

[F2] Enviro (Hardware Environment)

This window allows viewing of, but no modifications to, the "Hardware Environment" window. Included in the "Hardware Environment" category are such items as frequency range, etc., which are fundamental hardware conditions.

[F7] Data Dump

This is a hexadecimal data map for the current data of the VXR-1000, and this function is only used at the factory.

CE-22 Program Software

[F8] Ch Edit

This optional causes you to exit the [F2] (Common) window and return to the Channel Editing screen.

B-2: Sub-Functions within [F3] (Disk Load) and [F4] (Disk Save)

[F1] Help

This command provides a Help file for each available setting.

[F3] Mk Dir

This command allows you to create a new directory in which to store channel data for archive purposes.

[F4] Delete

This command allows you to delete a chan-

nel data file, when it is no longer needed for archive purposes.

[F8] Ch Edit

This optional causes you to exit the [F3] (Disk Load) or [F4] (Disk Save) window and return to the Channel Editing screen.

B-3: Sub-Functions within [F5] (Read ROM) and [F6] (Write ROM)

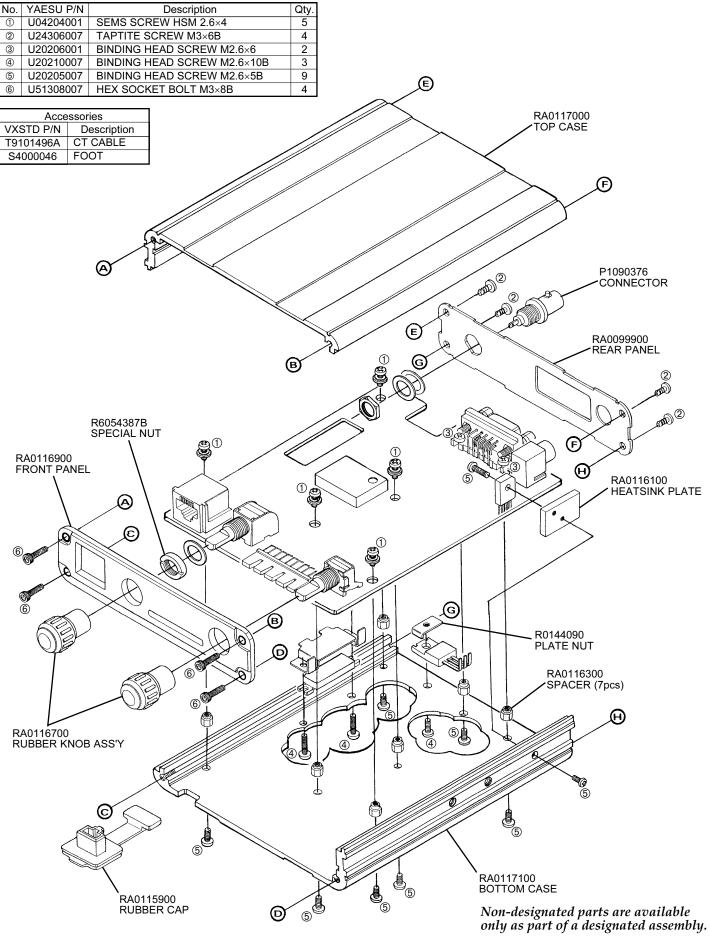

[F1] Help

This command provides a Help file for each available setting.

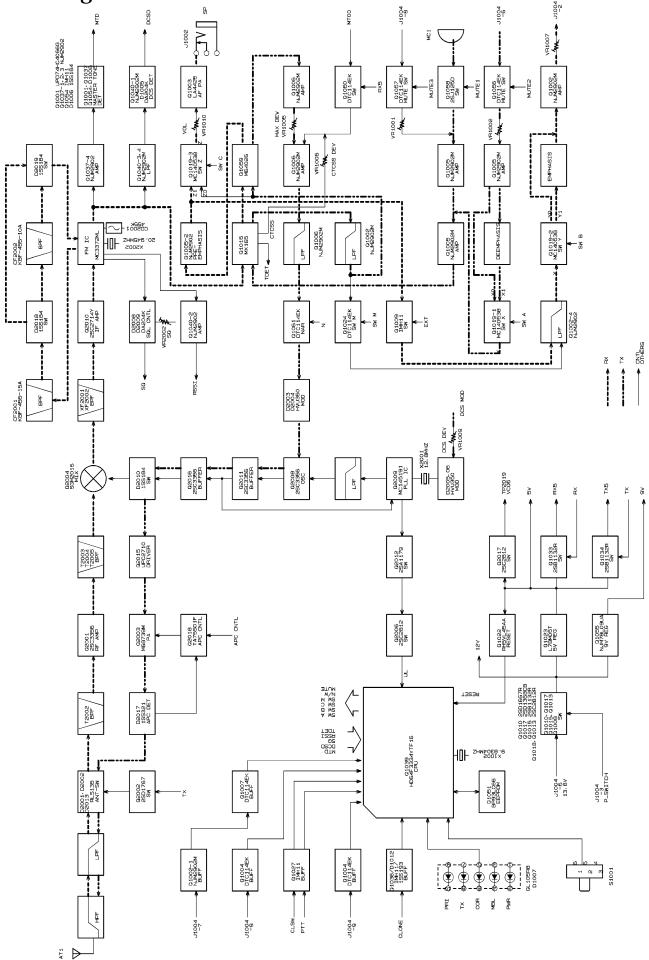

[F8] Ch Edit

This optional causes you to exit the [F5] (Read ROM) or [F6] (Write ROM) window and return to the Channel Editing screen.

Exploded View & Miscellaneous Parts

Block Diagram

Circuit Description

Reception and transmission are switched by "RX5V" and "TX5V" lines from the microprocessor unit (MPU). The receiver uses double-conversion superheterodyne circuitry, with a 21.4 MHz 1st IF and 455 kHz 2nd IF. The 1st LO, produced by a PLL synthesizer, yields the 21.4 MHz 1st IF.

The 2nd LO uses a 20.945 MHz (21.4 MHz-455 kHz) signal generated by a crystal oscillator. The 2nd mixer and other circuits use a custom IC to convert and amplify the 2nd IF, and detect FM to obtain demodulated signals. During transmit, the PLL synthesizer oscillates at the desired frequency directly, for amplification to obtain RF power output. During transmit, voice modulation and CTCSS (or DCS) modulation are applied to this synthesizer. Transceiver functions, such as tx/rx control, PLL synthesizer settings, and channel programming, are controlled using the MPU.

Receiver

Incoming RF signals from the antenna connector are delivered to the MAIN Unit, and pass through a low-pass filter (LPF) consisting of coils L2001, L2002, L2004, and L2024, capacitors C2002, C2004, C2009, C2111, C2112, C2113, and C2114, and antenna switching diodes D2001, D2002, and D2013 for delivery to the receiver front end.

The signals are then band-pass filtered and amplified by Q2001 (**2C3356**). The signals are then fed to the input of the 1st mixer, Q2004 (**SGM2016AM**), where they are mixed with the 1st local signal from the PLL. The 21.4 MHz 1st mixer product then passes through monolithic crystal filters XF2001 and XF2002, and is amplified by Q2010 (**2SC2714Y**) and delivered to the input of the FM subsystem IC Q2013 (**MC3372ML**). This IC contains the 2nd mixer, a local oscillator, limiter amplifier, FM detector, and audio amplifier. The 2nd LO in the IF-IC is produced from crystal X2002 (20.945 MHz), and the 1st IF is converted to 455 kHz by the 2nd mixer and stripped of unwanted components by ceramic filters CF2001 and CF2002. After passing through a limiter amplifier, the signal is demodulated by the FM detector.

Demodulated receive audio from the IF-IC is amplified by Q1005 (**NJM2902M**). After volume adjustment by the AF power amplifier Q1003 (**LA4425A**), the audio signal is passed to the speaker jack.

PLL synthesizer

The 1st LO maintains stability from the PLL synthesizer by using a 12.8 MHz reference signal from crystal X2001. PLL synthesizer IC Q2009 (**MC145191F**) consists of a prescaler, reference counter, swallow counter, programmable counter, a serial data input port to set these counters based on the external data, a phase comparator, and charge pump.

The PLL-IC divides the 12.8 MHz reference signal by 1,280 using the reference counter (10.0 kHz comparison frequency). The VCO output is divided by the prescaler, swallow counter and programmable counter. These two signals are compared by the phase comparator and applied to the charge pump. A voltage proportional to their phase difference is delivered to the lowpass filter circuit, then fed back to the VCO as an error-correcting voltage, controlling and stabilizing the oscillating frequency.

The VCO is comprised of Q2008 (**2SC3356**) and D2003 (**HVU350**), and oscillates at 21.4 MHz during receive, and at the fundamental frequency during transmit, with direct frequency-modulation using varactor diode D2004 (**HVU350**). The VCO output passes through buffer amplifier Q2011 (**2SC3356**), and a portion is fed to the PLL IC, and at the same time amplified by Q2016 (**2SC3356**) to obtain stable output. The VCO DC supply is regulated by Q2017 (**2SC2812**). Synthesizer output is fed to the 1st mixer by diode switch D2010 (**1SS184**) during receive, and to drive amplifier Q2015 (**µPC2710**) for transmit. The reference oscillator feeds the PLL synthe-

Circuit Description

sizer, and is composed of crystal X2001 (12.8 MHz), the temperature compensation circuit which includes D2007 (**1SS353**) and thermostats TH2001 and TH2002, and the transmit (DCS) modulation circuit D2005/ D2006 (**HVU350**×2).

Transmitter

Voice audio from the microphone or external inputs passes through a low-pass filter Q1005 (**NJM2902M**), and a limiter amplifier and lowpass filter at Q1006 (**NJM2902M**), then is adjusted for optimum deviation level and delivered to the next stage.

Voice input from the microphone, or external inputs and CTCSS, are frequency-modulated at the VCO of the synthesizer, while DCS audio is modulated by the reference frequency oscillator of the synthesizer. Synthesizer output, after passing through diode switch D2010 (**1SS184**), is amplified by driver Q2015 (**µPC2710**) and power module Q2003 (**M68739M**) to obtain full RF output. The RF energy then passes through antenna switch D2001/ D2002 and a low-pass filter circuit and finally to the antenna connector.

RF output power from the final amplifier is sampled by C2117 and C2118 and is rectified by D2017 (**1SS321**). The resulting DC is fed through Automatic Power Controller Q2018 (**TA75S01F**) to transmitter power module Q2003.

Generation of spurious products by the transmitter is minimized by the fundamental carrier frequency being equal to the final transmitting frequency, modulated directly in the transmit VCO. Additional harmonic suppression is provided by a low-pass filter consisting of L2001, L2002, and L2024 and C2002, C2004, C2009, C2111, C2112, C2113, and C2114, resulting in more than 60 dB of harmonic suppression prior to delivery to the RF energy to the antenna.

DCS Demodulator

DCS signals are demodulated on the RF-UNIT, and are applied to low-pass filter in sections 3 and 4 of Q1040 (**NJM2902M**), as well as the limiter comparator in section 1 of Q1040.

CTCSS encoder/decoder

Generation, demodulation, and detection of the CTCSS tones are carried out by IC Q1014 (**MX165C**).

MPU

Operation is controlled by 8-bit MPU IC Q1039 (**HD64F3334YTF**). The system clock uses a 9.8304 MHz crystal for a time base. IC Q1015 (**RH5VL45AA**) resets the MPU when the power is on, and monitors the voltage of the regulated 5V power supply line.

EEPROM

The EEPROM retains Tx and Rx data for all 16 channels, CTCSS data, DCS data, prescaler dividing, IF frequency, local oscillator injection side (upper/lower), and REF oscillator data (internal/external).

Alignment

The VXR-1000 has been aligned at the factory for the specified performance across the frequency range specified for each version.

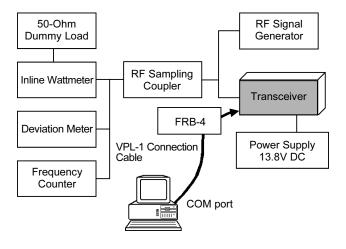

Realignment should therefore not be necessary except in the event of a component failure, or after alteration of the repeater version. All component replacement and service should be performed only by an authorized Vertex representative, or the warranty policy may be voided.

The following test equipment is required for alignment:

- O IBM PC/compatible computer w/Vertex VPL-1 cable, FRB-4, and CE-22 channel programming diskette.
- O RF signal generator: calibrated output level at 1000 MHz (0 dB μ = 1.0 μ V closed circuit)
- O Deviation meter (linear detector)
- O AF millivoltmeter
- O SINAD meter
- O Inline wattmeter: 1000 MHz, 10 W scale
- O Regulated DC power supply: adjustable from 10 to 17 V, 3 A
- O 50-Ohm non-reactive dummy load: 10 W at 1000 MHz
- O Frequency counter: 0.2 ppm accuracy at 1000 MHz
- O AF signal generator
- O DC Voltmeter: high impedance
- O RF Sampling Coupler (attenuation pad)

Before beginning, connect the transceiver and PC using the VPL-1 cable and FRB-4 as shown below, and download the EEPROM data from the transceiver to the computer.

Store this data in a disk file so that it can be saved and retrieved later. Using the table below, program the channel, CTCSS, and DCS alignment settings for your transceiver version. Upload this file to the transceiver.

PLL & Transmitter

Set up the test equipment as shown for Alignment Setup. Adjust the supply voltage to 13.8 V for all steps. Refer to the "Alignment Points" photo for alignment locations.

PLL Reference Frequency

Tune the transceiver to channel #3, connect the sampling coupler and frequency counter between the antenna connector and RF dummy load, key the transmitter, and adjust TC2001 on the MAIN Unit for precisely 162.00 MHz (±100 Hz).

PLL VCV

- Leave the RF sampling coupler in-line between the antenna jack and the RF dummy load. Connect the frequency counter to the coupler.
- Connect the DC voltmeter between VCV test point TP2006 on the MAIN Unit and chassis ground.
- Set the transceiver to the low band edge channel #1. And adjust T2001 on the MAIN Unit for 0.5 V on the voltmeter.
- ☐ Select high band edge channel #2. Key the transmitter, and confirm the low-end VCV is less than 4.4 V on the voltmeter.

Alignment

Transmitter Output Power

☐ Turn the VXR-1000 off.

- Rotate the CHANNEL Selector Knob to the "16" position.
- Press and hold in the PTT switch while you turn the VXR-1000 on, then rotate the CHAN-NEL Selector Knob counter-clockwise to the "12" position while holding in the PTT switch continuously.
- Confirm that the "TX" and "PWR" LEDs are blinking, then release the **PTT** switch. The VXR-1000 now is in the Tx Power Alignment Mode.
- Rotate the CHANNEL Selector Knob to the "3" position.
- Press and hold in the PTT switch, and rotate the CHANNEL Selector Knob so as to achieve 5.0 Watts on the wattmeter.
- Release the PTT switch, then turn the VXR-1000 off.

CTCSS Modulation Level

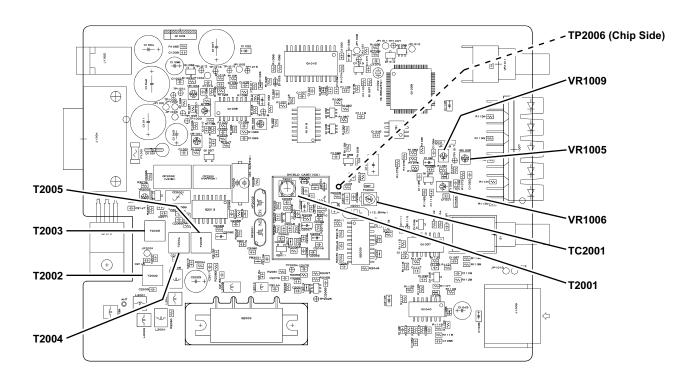

☐ Select channel #4, with 151.4 Hz CTCSS encode. Transmit, and adjust VR1006 on the MAIN Unit for 0.75 kHz (±0.05 kHz) deviation as indicated on the deviation meter.

DCS Modulation Level.

Select channel #5, with DCS 023 enabled. Transmit, and adjust VR1009 on the MAIN Unit for 0.75 kHz (±0.1 kHz) deviation as indicated on the deviation meter.

Microphone Audio Modulation Level

- □ Select channel #3, and adjust the AF generator for 30 mV_{rms} output at 1 kHz injection to the MIC jack.
- Transmit, and adjust VR1005 on the MAIN Unit for 4.2 kHz (±0.1 kHz) deviation as indicated on the deviation meter.

Alignment Points

Receiver

- With the transceiver set to (band center) channel #3, and the RF signal generator tuned to the same frequency, set the generator for 3.0 kHz deviation (for 25 kHz steps) with 1 kHz tone modulation, and set the output level for 100 μV at the antenna jack.
- Adjust T2002, T2003, T2004, and T2005 on the Main Unit for optimum SINAD, reducing the signal generator output level as necessary for proper meter deflection.
- $\hfill After the previous step, the final signal generator level should be less than 0.3 <math display="inline">\mu V$ for 12 dB SINAD.
- Squelch Threshold I

PC Alignment

- □ Select channel #3, and adjust the signal generator level for 0 dB μ (1.0 μ V).
- ☐ Adjust the squelch threshold level by the PC so that it just closes (RX LED turns off).

Manual Alignment

- **Turn the VXR-1000 off.**
- Rotate the CHANNEL Selector Knob to the "16" position.
- Press and hold in the PTT switch while you turn the VXR-1000 on, then rotate the CHAN-NEL Selector Knob counter-clockwise to the "13" position while holding in the PTT switch continuously.
- □ Confirm that the "PRI," "COR," and "PWR" LEDs are blinking, then release the **PTT** switch. The VXR-1000 now is in the Squelch Threshold Alignment Mode.

- Rotate the CHANNEL Selector Knob to the "2" position, and adjust the Signal Generator level for 0 dBµ (1.0 µV).
- Press and hold in the PTT switch, and rotate the CHANNEL Selector Knob so that the "RX" LED turns off (Squelch just closes).
- □ Release the **PTT** switch, then turn the VXR-1000 off.

Squelch Threshold II

You can now adjust the Squelch Threshold for each channel.

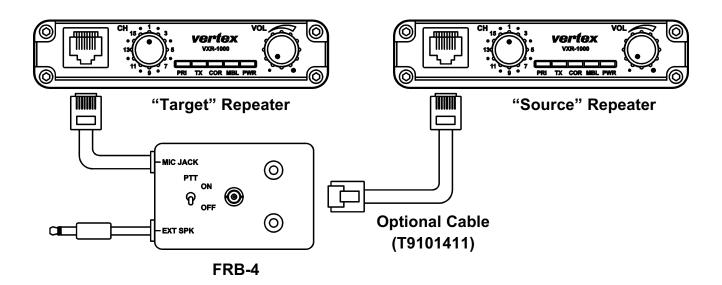

- Turn the VXR-1000 off.
- Rotate the CHANNEL Selector Knob to the "16" position.
- Press and hold in the PTT switch while you turn the VXR-1000 on, then rotate the CHAN-NEL Selector Knob counter-clockwise to the "14" position while holding in the PTT switch continuously.
- Confirm the "MBL," "COR," and "PWR" LEDs are blinking, then release the **PTT** switch. The VXR-1000 now is in the Squelch Threshold Alignment (for each channel) Mode.
- □ Rotate the **CHANNEL** Selector Knob to the channel position where you wish adjust the squelch threshold level.
- Press and hold in the PTT switch, and rotate the CHANNEL Selector Knob so that the "RX" LED turns off (Squelch just closes).
- □ Release the **PTT** switch, then turn the VXR-1000 off.

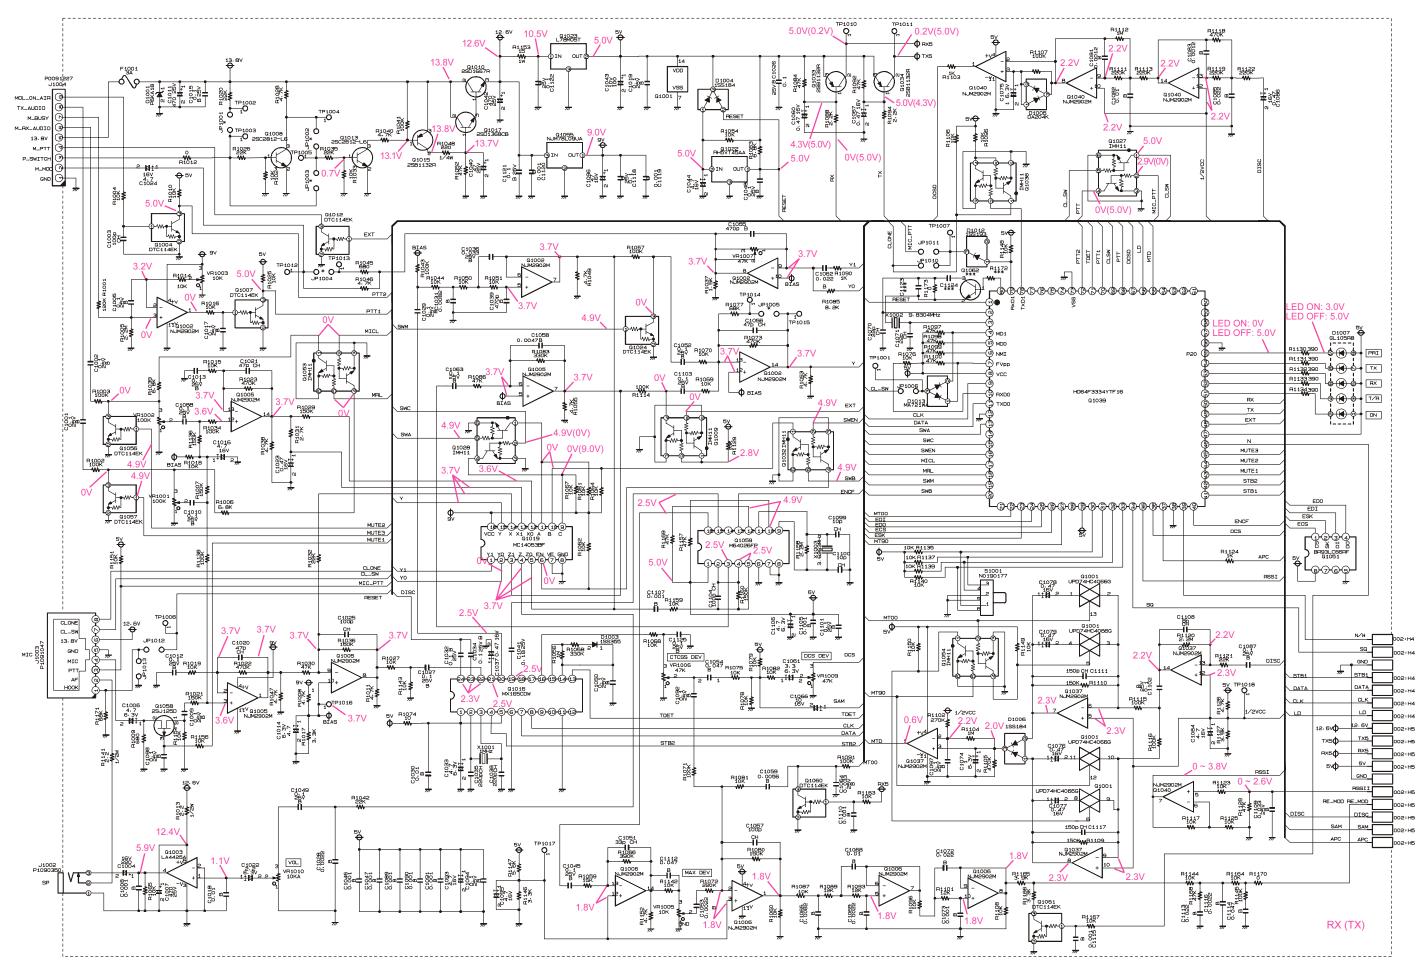

Repeater Cloning

You can transfer data stored in one VXR-1000 to another VXR-1000 by utilizing the handy "Cloning" feature. This requires the optional T9101411 Cable and FRB-4 Alignment Interface Box, so as to connect the Microphone jacks on the two repeaters as shown below.

To clone from one repeater to another, use the following procedure:

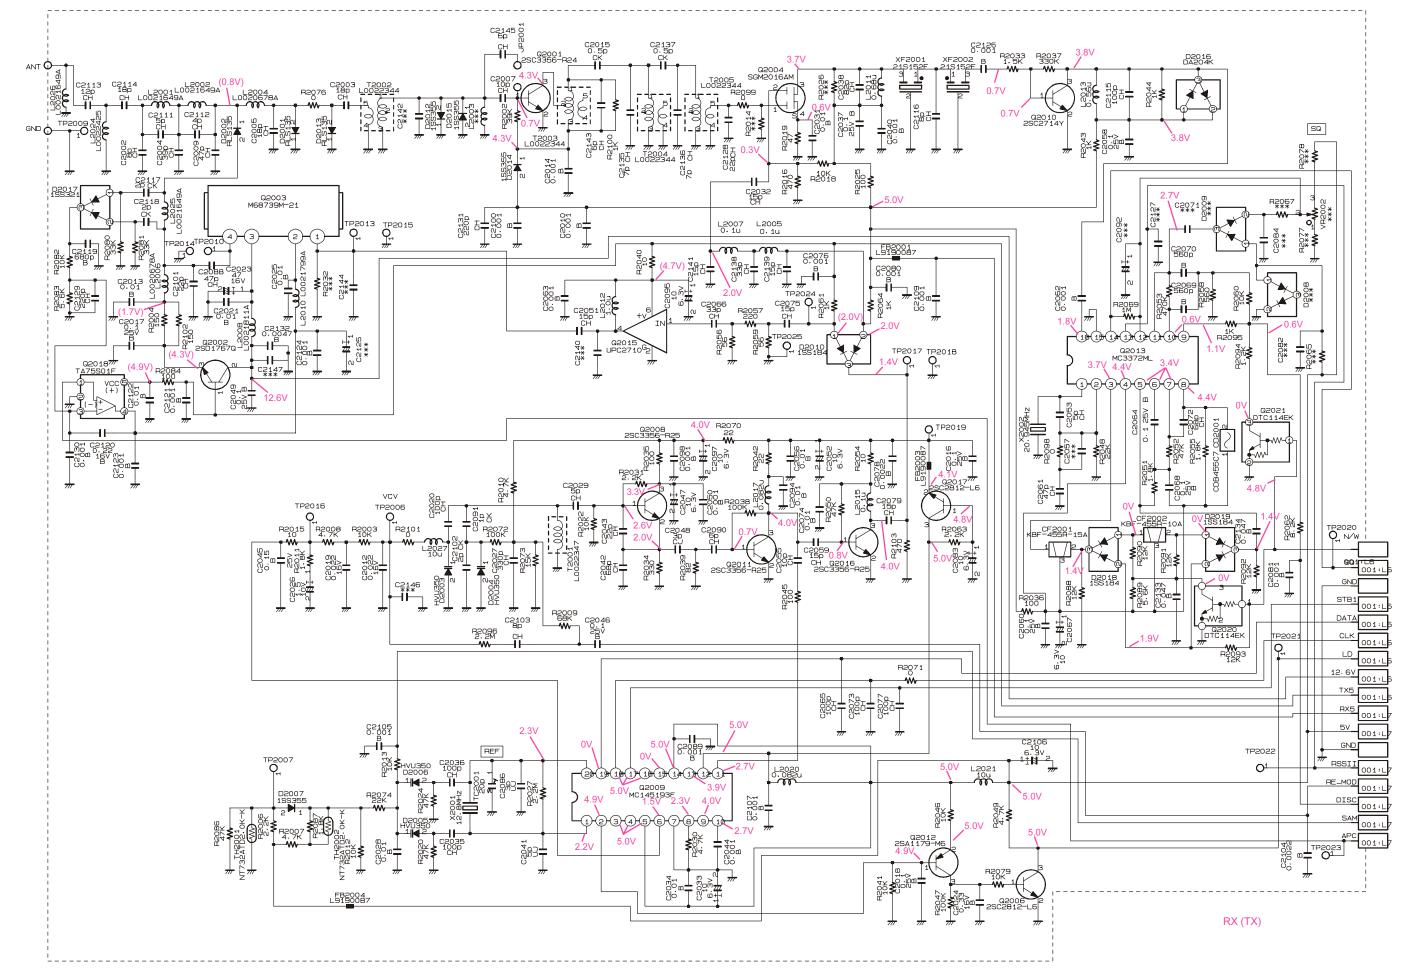

- ☐ Turn both repeaters off, and connect the T9101411 Cable between the FRB-4 modular jack and the "Source" repeater's Microphone jack. Turn the "Source" repeater **On**.
- Connect the FRB-4 modular connector to the "Target" repeater's Microphone jack.
- □ Turn the "Target" repeater On, and set the FRB-4's **PTT** switch to **On**. The "Source" repeater will now send its frequency data to the "Target" repeater.
- □ Wait two seconds, then turn the "Target" repeater off. Now turn the "Source" repeater **off**.
- Remove the T9101411 Cable and the FRB-4. All frequency data for the two repeaters are now identical. They both may be turned on now for normal operation.
