

Carburetor Rebuild Request

Thank you for choosing Mill Mountain Motorcycles for your Powersports needs. We are a unique Motorcycle and Powersports shop offering Sales, Parts, and Service for (almost) all makes, models, and model years. We specialize in vintage and hard to find parts with a focus on the Vintage Japanese market but will happily service and locate whatever you may need for any ride, old or new, foreign or domestic. Our aim is to provide modern solutions to mechanical problems, and while there may be other motorcycle carburetor "specialists" claiming superiority in the field, our team focus is fact based, results driven, pure carburetor a** kickin'.

Turn around time varies depending on the job, and time of year. Most carburetor rebuild jobs will be completed in an average of 2-5 weeks, however some special operations may take longer due to parts availability. Additional time is necessary for Vapor Honing, Jet Block Repair and Plating. It is especially important to NOT disassemble your carburetors before you ship them to us.

Please make sure you have our address labeled correctly. Incorrectly addressed packages will be delayed, or refused. Please package your carburetors following our recommendations. To easily find this, search "Packing Your Carburetor" on our website.

Ship To:

Mill Mountain Motorcycles

914 4th Street SE

Roanoke, VA 24013

It is important that we are thorough and critical of every part. The tiniest detail is vital to the end result, which is why every carburetor goes through a 14 point inspection before and after our service. Your carburetor will be completely disassembled down to bare, individual parts. These parts and assemblies are then ultrasonically cleaned and inspected for repair, machining, or replacement. Ultrasonic cleaning is a common procedure for high-quality cleaning, utilizing ultrasonic energy to scrub your parts. Ultrasonic cleaning is a technology unique in its ability to remove contaminants that other techniques cannot remove, as well as clean areas that are not accessible or visible.

Interested in the complete Restoration Experience?

- Vapor Honing eliminates the need to use harsh solvents, polishing by the flow of water and abrasive media, not by sheer force and impact. In other words, less resource is used to obtain the perfect satin finish, saving you time and money during your project.
- Zinc & Cadmium plating is an ideal technique when used in combating corrosion of steel. The zinc corrodes before the parent metal does, sacrificing itself for the benefit of the parent metal. A metallurgical bond is established between the zinc and parent forming a rich alloy with a highly corrosion resistant bond.
- Core Returns are subject to inspection. If you plan to return a core, please do so promptly. Please do not disassemble your core prior to shipment, we will reject any core that is not completely assembled. Core value is graded on a 100 point scale; 100 being the highest quality.
