

design : Paola Lenti

Floor covering composed of elements made of non-treated natural lava stone and inserts made of lava stone oxidized with metal powders.

Material:

Lava stone, or basalt, is a dark extrusive natural stone originating from the cooling of volcanic magma. The colour of the inserts is obtained through a working process that involves the use of natural metal oxides. The elements Origami are finished with a protection treatment.

Characteristics:

Lava stone is resistant to impacts, stress and wear, it is longlasting and easy to maintain. The surface of the elements may feature little differences in thickness and colour: this is to be considered the quality that makes each element unique and inimitable.

Dimensions:

Origami elements have a dimension of 25x25x2 cm.

Applications:

Floor covering, both indoors and outdoors, in residential, public and commercial spaces subject to light or heavy traffic.
