

# Improve Air Test Results with Particulate Conqueror

Bad Axe™ Particulate Conqueror is designed to control dust and mold in remediation, demo, water/fire-restoration cleanup and construction projects. Particulate Conqueror coalesces airborne and surface-borne particulate debris, immobilizing them, and increasing their mass. Its knockdown effect increases the HEPA capture efficiency of air scrubbers and HEPA vacuums. Used before, during and after your project, Particulate Conqueror is an inexpensive way to reduce potential cross-contamination, enhance source removal efforts and improve air sampling results.

- Improves probability of passing air sampling tests.
- Is ideal for jobs that require the use of air scrubbing devices.
- Increases particulate mass, improving capture efficiency of scrubbers and HEPA vacs.
- Helps control airborne particulate, enhancing containment efforts.
- Is a concentrate formula. Easy to mix. Inexpensive.
- Can be easily applied through either fogging or wiping.

## Customer Testimonial

“We believe that anybody who uses an air scrubber on a job will benefit from using Particulate Conqueror (PC). It is easy to implement into a job, and does a great job in improving the chances of passing an air test the first time. Each pint makes a RTU gallon. Each RTU gallon easily covers 3,000 cubic feet. At the low cost, with that coverage, it’s crazy not to make it a closing step in our remedial process.”
