Pressure Washer Set up and Maintenance guide – Please read before using

We have a dedicated video set up guide online ready to watch at <https://goo.gl/9KDyu9>

Important things to note when using this Pressure Washer:

- The first step is to make sure the wheels are connected to create a level surface for the machine to run on.
 - Place the oil into the filling location using a funnel, you'll need around 700ml to fill the machine, fill with oil until it's about to overflow, then you know you have around 700ml. We recommend 4 stroke oil, however 2 stroke oil can still be used.
 - Adjust the two levers according to the manual/video, once the machine has started you'll need to re-adjust these to keep the engine running smoothly.
 - Be gentle with the pulley if the tension is high during start up.
-

Important aftercare information:

- If the machine has not been used for a couple of weeks you'll need to drain the fuel as shown in the video and refill with fresh fuel.
 - If the machine has not been used for over 4 weeks please drain and use fresh oil also.
 - Based on the above information we recommend draining all fluids if you're not going to be using the washer for a prolonged time.
-
