CLINICALLY PROVEN TO DISSOLVE  
WAX IN ONE TREATMENT

## WHAT IS EARWAX?

Earwax is a naturally occurring substance that lubricates and protects the inside of your ear from dirt, bacteria, and anything else that might try to sneak its way into the ear canal. However, too much earwax can lead to negative side effects. Frequent use of hearing aids and earbuds can increase production of earwax and lead to clogged ears and hearing aids.

## HOW TO USE EARWAX MD IN 6 EASY STEPS

### STEP 1

Lie down on your side in a comfortable position. Be sure your ear is parallel to the surface so that nothing drips out of your ears. Place a towel on your shoulder just in case anything drips.

### STEP 2

Take the bottle of EARWAX MD and fill the dropper with the solution.

### STEP 3

With your head tilted to the side, slowly fill the ear canal with EARWAX MD, one drop at a time. All ear canals are shaped differently, so the amount of drops required to fill the ear canal will vary. Once your ear canal feels full, you are finished with the drops.

### STEP 4

Set a timer for 15 minutes and wait.

### STEP 5

After 15 minutes, it is time to rinse your ear. You should either:

- Fill the purple bulb with warm water and lean your head over a bowl or bathroom sink to flush the ear canal.
- Stand under the shower head with your head tilted to let warm water stream into the ear canal and flush out the wax.
- Use WAX BLASTER MD® (sold separately) for a luxurious rinsing experience. Simply hold the ergonomically designed bottle and spray into your ear.

You may see cloudy water, or wax coming out in chunks. This means it's working! Depending on the amount of wax in your ear canal, you may need to rinse 10 or more times to fully flush out the wax. If your ear is not clear, you may need an additional 15-minute treatment.

### STEP 6

Repeat steps 1-5 on your other ear!
