Executive Overview

The Market Outlook

In terms of worldwide military budgets, the unmanned aircraft systems (UAS) segment continues to see growth, although annual growth has moderated when compared to a decade ago. The unclassified sector will continue to increase over the next decade, by about 66%, from current annual spending on RDT&E and pro-

the first half of the forecast period, and then potentially grow significantly if the USAF Cooperative Combat Aircraft (CCA) bears fruit (this is covered below and in the US section). Another big issue for the US drone sector is the extent of secret “black” drone programs, some of which may involve CCA.

strong potential for the future as airspace begins to open worldwide. We have included a summary of those findings, however, at the end of this Executive Overview.

Please note that in our tables and charts “procurement” and “production value” are two different, but related numbers. Procurement, covered

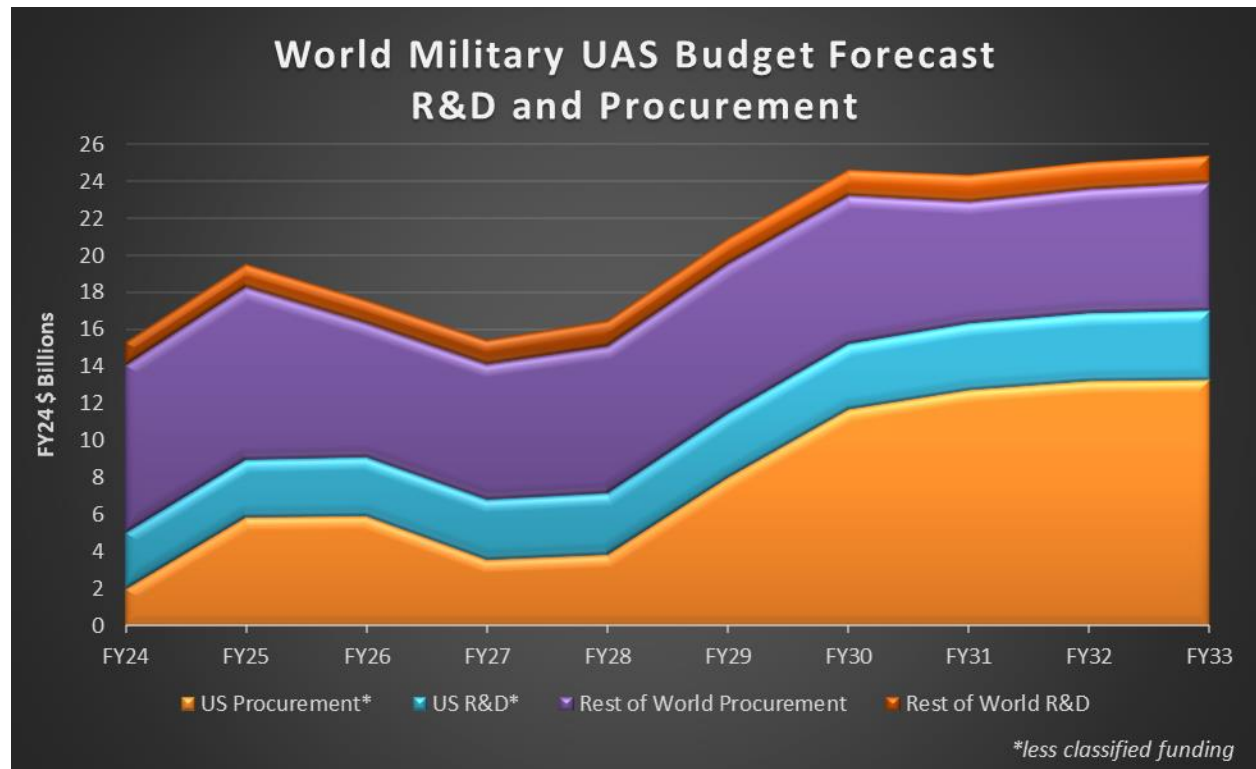

Figure 1

curement of about \$15.3 billion in FY24 to about \$25.4 billion in FY33 (a CAGR of 5.8%). If operations and maintenance expenditures were to be added, these totals would be greater. (Note: we use the US fiscal year cycle here as the standard for comparison purposes, even though each country uses its own budget cycle.)

This growth is being driven by the continued adoption of unmanned aerial vehicles (UAVs) worldwide. Over the next decade, unclassified US procurement will grow modestly during

Growth will increasingly shift towards international markets as more militaries adopt the lessons of Iraq, Afghanistan, Syria, Libya, Nagorno-Karabakh, and Ukraine and incorporate UAVs into their forces (see Figure 1). The introduction of specially built unmanned combat air vehicles (UCAVs) also promises to drive growth over the next decade.

Now, for the seventh year Teal Group has separated all civil government and commercial UAVs into a separate study in recognition of the

in the budget forecasts here, represents the annual amount of production funding included in a country’s annual defense budget, usually on a fiscal-year basis. Production value, covered in the numerous tables in this study, represents the value of UAV systems delivered during a calendar year. In rough terms, the funds “procured” during one-year result in “delivered” units the following year or two after.

The most significant catalyst to this market has been the enormous

growth of interest in UAVs by the US military, tied to operations in Iraq and Afghanistan, as well as the general trend towards information warfare and netcentric systems. UAVs are a key element in the intelligence, surveillance, and reconnaissance (ISR) portion of this revolution, and they are expanding into other missions as well with the advent of hunter-killer UAVs. The reason for the slow-down in US growth has

These percentages change significantly when adjustments are made for US classified UAV development and procurement funding (see Figure 2). The value of these “black” programs can only be surmised. With these assumptions, the US accounts for 81.1% of the world R&D on UAVs and 59% of the procurement.

This difference is due to the heavier US investment in cutting-edge technologies and the marked lag-

came down in Iranian territory. Recent revelations about the RQ-180 provide another example.

Teal Group expects that the sales of UAVs will follow recent patterns of high-tech arms procurement worldwide, with the Asia-Pacific area representing the second largest market, followed by Europe. Indeed, the Asia-Pacific region may represent an even larger segment of the market, but several significant play-

Figure 2

been the decline of US unclassified procurement over the past decade with the end of the wars in Iraq and Afghanistan. The US military currently has the world’s largest and most sophisticated drone fleet, with the rest of the world only beginning to catch up.

Our research finds that the US will account for 71.5% of the unclassified R&D spending on UAV technology over the next decade, and about 51.2% of the unclassified procurement through the forecast decade.

time in such research and procurement elsewhere, especially major aerospace centers such as Europe. This follows trends in other cutting-edge technologies observed over the past decade by Teal Group analysts in such areas as precision-guided weapons, information and sensor technology, and military application of space systems.

A tangible example of the “black” UAV budget in the US is the RQ-170 Sentinel program which only came to light when one of the stealth drones

ers in the region, namely Japan and China are not especially transparent about their plans compared to Europe. As in the case of many cutting-edge aerospace products, Africa and Latin America are expected to be very modest markets for UAVs.

Some warnings are needed when viewing the summary tables and charts here. There appear to be wide swings and dips in unit acquisition over the forecast decade, that is not matched by similar swings in the production value. This is primarily due

to the volatile mini-UAV market, which represents exceptionally large numbers of air vehicles even though unit costs are extremely low compared to other UAVs, especially the endurance types. This forecast expects a drop in US mini-UAV acquisition as combat operations wind down in Iraq and Afghanistan, which has a significant effect on unit numbers, though not on dollar values. It is also important to note that we are not yet including forecasts for quadcopters, or very small and inexpensive micro-UAVs. In many cases, these are being obtained off-the-shelf from

the commercial market, and the unit cost is too low for any form of tracking. In addition, the large numbers likely to be acquired tend to grossly distort the unit forecast numbers.

The summary tables below include a budget forecast, as well as UAV production forecasts based on the various program unit forecasts. As can be seen, the procurement aspect of the budget forecast is higher than the production forecast (by value). The procurement forecast captures costs other than the acquisition costs alone, such as modification programs, acquisition of system

components including sensors, ground control stations and support equipment. Since US classified programs are so speculative, we have included two separate budget forecasts here, one that excludes the US classified programs and one that includes them.

The US lines are derived from the US budget procurement forecast found in the US section. The "Rest of the World" procurement line is based on the production forecast, plus a fractional addition to account for the other UAV costs.

World UAS Budget Forecast (excluding US classified budget)
