

## Measure your fence/gates

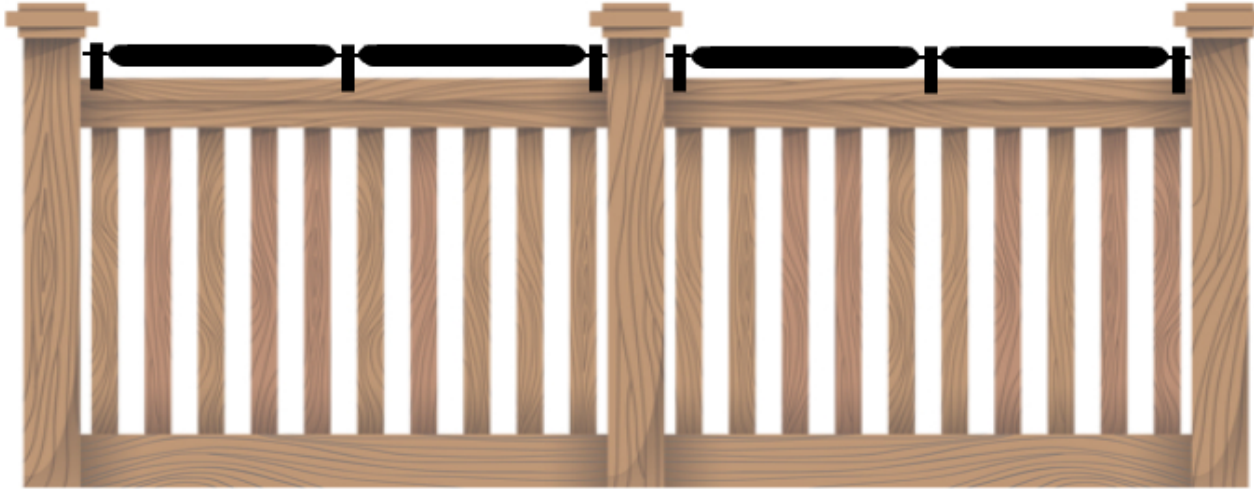

\*Map is not to scale.

*You will need to cut Rollers when coming to the end of the fence run and installing over gates. Please see installation guide/videos for advice on cutting rollers.*

## Regardless of your fence style

- If you have a post that is taller than top rail (panel sections), Brackets will need to be installed on each side of a post
- If you have no tall posts and/or a continuous line of top rail, without interruption, one bracket between every two (2) rollers is needed.
- A fence panel that "steps" up or down will be treated in this same manor, as will corners

## Gates

- Gates are treated just like panels with a Roller place only on the swinging part of the gate
- Rollers continue on either side of a gate
- Fence posts may be covered with a Roller if the size of post permits
