It also allows dual op-amps rolling to tailor the audio experience.

Steps for replacing the op-amps:

1. On the PCBA board, there are marked positions for the left and right channel op-amps. 'L-OPAMP' indicates the left channel, while 'R-OPAMP' indicates the right channel. Please confirm which channel's op-amp needs replacement;

2. Use tweezers to carefully remove the op-amps. Every op-amp has a direction, please find the number 1 marking or the circular/semi-circular notch on the cover of the op-amp, align it with the position marked O1 on the PCBA board, and plug the op-amp into the socket;

Frequently Asked Questions

1. Why is there no sound after all the devices are connected?

- The amplifier is not powered on, please check whether the mode indicator is on;
- The volume of the amplifier is too small, please turn the volume knob clockwise and adjust it to the right level;
- The audio cable is connected incorrectly, please reconnect it according to the steps in the instruction manual;
- The audio source is not playing or muted, please check the audio source equipment.

2. After a successful connection, the sound is abnormal?

- Polarity reversed. Please check if the speaker wires are correctly connected with the red as positive and black as negative;
- Poor speaker wire contact. Reconnect or replace the speaker wire. For RCA/XLR cables, reestablish the connections or try using different RCA/XLR cables;
- Amplifier overload. Reduce the volume if the amplifier is experiencing overload.

3. Unable to play properly after connecting the turntable?

- The turntable lacks a built-in preamp: Please check if your turntable has a built-in preamp. The ZA3 does not have a built-in turntable preamp, so you need to connect an external turntable preamp between your turntable and the ZA3. For example, Fosi Audio Box X1, X2, X4, etc.
- Incorrect turntable output mode: Turntables with built-in preamps typically offer both turntable output and line output options. Please select the line output.
