

Customer Name: _____

Email: _____

Mobile Number: _____

Notes:

When providing dimensions or diagrams always remember to provide A x B x C as shown above.

Measuring tips:

1. Check the substrate or ground surface for any bumps or humps that the ramp will lay on.
2. If possible, view from ground level the step height when taking measurement this will ensure a more accurate measurement.
3. If you have access to a straight edge or level simply place it 90 degrees on top of the step and measure underneath it, this will allow you to measure 2 steps at once and will give you an accurate measurement.

Things you will need when installing:

1. Flexi blade (Stanley Knife)
2. Tape Measure
3. High grade silicon
4. White marker or white pencil
5. Straight edge or combination square

Installation guide:

1. If the ramp needs trimming you can do this by marking where it needs to be cut, then by slicing the ramp gradually. We recommend using a straight edge or combination square to help mark and run blade against.
2. If ramp requires fixing in place simply put a silicon bead, make sure you run the silicon in a direction that will allow trapped water to escape from under ramp. This will avoid any mould in future.

If you would like us to make the installations for you please contact us. There will be an Installation fee.
