DANGER: CARBON MONOXIDE

Using a generator indoors CAN KILL YOU IN MINUTES. Generator exhaust contains carbon monoxide (CO). This is a poison gas you cannot see or smell. If you can smell the generator exhaust, you are breathing CO. But even if you cannot smell the exhaust, you could be breathing CO.

NEVER use a generator inside homes, garages, crawlspaces, or other partly enclosed areas. Deadly levels of carbon monoxide can build up in these areas. Using a fan or opening windows and doors does NOT supply enough fresh air. ONLY use a generator outside and far away from windows, doors, and vents. These openings can pull in generator exhaust.

Even if you use a generator correctly, CO may leak into the home. ALWAYS use a battery-powered or battery-backup CO alarm in the home. If you start to feel sick, dizzy, or weak after the generator has been running, move to fresh air RIGHT AWAY. See a doctor. You may have carbon monoxide poisoning.

WARNING: The exhaust from this product contains chemicals known to the State of California to cause cancer, birth defects, or other reproductive harm.

WARNING: This generator may emit highly flammable and explosive gasoline vapors, which can cause severe burns or even death if ignited. A nearby open flame can lead to explosion even if it isn't directly in contact with gasoline.

- Do not operate near open flame.
- Do not smoke near generator.
- Always operate on a firm, level surface.
- Always turn generator off before refueling. Allow generator to cool for at least 2 minutes before removing fuel cap. Loosen cap slowly to relieve pressure in tank.
- Do not overfill fuel tank. Gasoline may expand during operation. Do not fill to the top of the tank. Allow for expansion.
- Always check for spilled fuel before operating.
- Empty fuel tank before storing or transporting the generator.

WARNING: This generator produces powerful voltage, which can result in electrocution.

ALWAYS ground the generator before using it (see the "Generating set ground" portion of the "GENERATOR PREPARATION" section).

Generator should only be plugged into electrical devices, either directly or with an extension cord.

NEVER connect to a building electrical system without a qualified electrician. Such connections must comply with local electrical laws and codes. Failure to comply can create a back-feed, which may result in serious injury or death to utility workers.

- Use a ground fault circuit interrupter (GFCI) in highly conductive areas such as metal decking or steel work. GFCIs are available in-line with some extension cords.
- Do not use in rainy conditions.
- Do not touch bare wires or receptacles (outlets).
- Do not allow children or non-qualified persons to operate.

WARNING: This generator produces heat when running. Temperatures near exhaust can exceed 150 F (65 °C).

Do not touch hot surfaces. Pay attention to warning labels on the generator identifying hot parts of the machine.

Allow generator to cool down after use before touching engine or areas of the generator that become hot during use.

CAUTION: Misuse of this generator can damage it or shorten its life.

Only use generator for its intended purposes.

Operate only on dry, level surfaces.

Allow generator to run for several minutes before connecting electrical devices.

Shut off and disconnect any malfunctioning devices from generator.

Do not exceed the wattage capacity of the generator by plugging in more electrical devices than the unit can handle.

Do not turn on electrical devices until after they are connected to the generator.

Turn off all connected electrical devices before stopping the generator.

Turn the engine switch to “OFF” position when the engine is not running.

IMPORTANT SAFETY INSTRUCTIONS

SAVE THESE INSTRUCTIONS – This manual contains important instructions for the PowerSmart® 4500W generator that should be followed during installation and maintenance of the generator.

Generators vibrate in normal use. During and after the use of the generator, inspect both the generator as well as extension and power supply cords for damage resulting from vibration. Have damaged items repaired or replaced as necessary. Do not use plugs or cords that show signs of damage such as broken or cracked insulation.

For power outages, permanently installed stationary generators are better suited for providing backup power to the home. Even a properly connected portable generator can become overloaded. This may result in overheating or stressing of the components, possibly leading to a generator failure.

WARNING: If this generator is used as a supply for a building’s wiring system, the generator must be installed by a qualified electrician and connected to a transfer switch as a separately derived system in accordance with the National Electrical Code, NFPA 70. The generator shall be connected to a transfer switch that switches all conductors excluding the equipment grounding conductor. The frame of the generator shall be connected to an approved grounding electrode.

CO alarm - Carbon Monoxide (CO) Detection and Auto-shutoff System

The CO alarm technology monitors the accumulation of poisonous CO gas produced by engine exhaust when the generator is running. If CO alarm detects elevated levels of Co gas, it automatically shuts off the engine. Generators are intended to be used outdoors, far away from occupied buildings and exhaust pointed away from people and buildings.

If misused and operated in a location that results in the accumulation of CO inside an enclosed or partially enclosed space, for example a house, garage or a garage with the door partially open, CO alarm will automatically shut off the generator and then illuminate a red LED. Read the action label for what steps to take. CO alarm is not a substitute for an indoor carbon monoxide alarm.

When you approach the generator to investigate a shut off, a blinking red LED light in the CO alarm area provides notification that the generator shut off due to an accumulating CO hazard. The red LED light will blink for at five (5) minutes after a shutdown event.

Move the generator to an open, outdoor area and point the exhaust away from people and buildings. Once relocated to a safe area, the generator can be restarted, and the proper electrical connections made. Introduce fresh air and ventilate the location where the generator shut off.

When starting, the red and yellow LED will blink fifteen (15) times simultaneously to indicate the LED is working.

NOTICE: This blinking does not indicate CO alarm is working, as CO alarm is working at all times the generator is running.

If CO alarm system experiences a fault and no longer provides protection, the generator is shut off automatically and the yellow LED light will blink for at least five (5) minutes to notify you of the fault.

NOTICE: When the yellow warning light is on while the generator is working, please turn off the generator and send the generator to authorized dealer and repair it.

CO alarm will detect the accumulation of carbon monoxide from other fuel burning sources such as engine powered tools, or propane heaters used in the area of operation. If another generator is used and the exhaust is pointed at a CO alarm equipped generator, the CO alarm may initiate a shutdown due to rising carbon monoxide levels. This is not a fault. Hazardous carbon monoxide has been detected. You must take action to move and direct the equipment to better dissipate carbon monoxide far away from people or buildings.

WARNING: Tampering with the CO alarm system could result in a hazardous condition and will void your warranty.

Removing the CO alarm module will not allow the generator to start.

It will stop the output of generating set to protect the electric equipment and the generating set itself. At this time, the running indicator (green) is off and the overload indicator (red) is on, but the engine is still in running state.

- When the generating set has no output and the overload indicator is on, please take the following steps:
1. Lower the total power of the connected electric devices to the rated output range of generating set.
 2. Check the air intake for impurities and check the control parts for abnormal situation. Handle immediately if necessary.
 3. Press the reset button.

Running indicator (green)

The running indicator lights up when generating set starts and has normal output.

Oil alarm lamp (yellow)

When the oil level drops below the lower limit, the oil protection system will stop the engine automatically and oil alarming lamp will blink by pulling the recoil starter. The engine will not run until the oil has been filled to the proper level.

Note: If engine flames out or fails to start, turn the combination switch to “RUN” position and then pull the recoil starter. If the oil alarming lamp lights up, it shows lack of oil. Please add appropriate oil and restart the engine.

Rest button

The reset button is used to restore output if an overload occurs. To restore output, reduce the loads and press the rest button.

Energy-saving switch

When the energy-saving switch is in “ON” position, the energy saving equipment controls the engine rotate speed according to the connected loads. There will be good fuel consumption and low noise. When the energy-saving switch is in “OFF” position, the engine will always run in rated rotate speed no matter it is connected to the loads or not.

Note: Please set the energy-saving switch to “OFF” position when connect to air compressor, sinking pump etc. because these equipments need large starting current.

Grounding terminal

The grounding terminal is designed to prevent electric shock by connecting it to the grounding wire. The generating set must be properly grounded before operation.

Combination switch (STOP&OFF&RUN&CHOKE)

Note: One-button start and remote control start, no function of manually close for the choke.

Stop: The stop position of the generator.

Note: After the generating set is unloaded, please run for 3 minutes at no load to stabilize the temperature, then stop the generating set.

Off: Fuel off without stop. This position can run out of the remaining fuel and improve the reliability of the generating set.

Note: If you do not plan to use the generator in the near future, please use this function, or drain the fuel inside the carburetor through the carburetor drain bolt.

Run: The generating set operates normally.

Choke: Close the choke.

Note: Turn to choke position to start when engine is cold, and turn to Run position to start when engine is hot.

Circuit breaker

When the generator is overloaded or overheated for a long time, the thermal protector works. Under protected, please reduce the load or run it for a few minutes without load. Press the thermal protector button, then output recovers.

Note: The thermal protector is influenced by factors, such as operation current and ambient temperature, so the protection time varies.

Parallel kit terminal

It used for parallel operation with another inverter.

Fuel tank cap

Remove the fuel tank cap by rotating it anticlockwise.

Telescoping handle

When moving the generator, please hold the telescoping handle and press the button on it, and pull it outward.

Note: Before moving, please turn off the generator and fuel switch. Please move the generator on a relatively flat ground. Do not perform the movement on a surface where the pit exceeds 40mm.

GENERATOR PREPARATION

The following section describes steps necessary to prepare the generator for use. If after reading this section, you are unsure about how to perform any of the steps please call **(800) 791-9458 & (888) 293-0024 Mon-Fri 9-5 EST** for customer service. Failure to perform these steps properly can damage the generator or shorten its lifespan.

Unpacking

Unpack the generator and all its parts. Do not discard the carton or any packaging until the generator is completely assembled.

1. Operating Location

- Only use OUTSIDE and place the generating set in a well-ventilated area.
- Only operate the generating set on a flat, level surface and in a clean, dry operating environment.
- Allow two feet clearance on all side of the generating set while operating it outdoors.
- Operate in specified area, if any problem on applicable occasion, please consult the authorized local dealers. In some areas, generating set must be registered with the local utility. Generating set used to construction sites may be subject to additional rules and regulations.

DANGER: The exhaust of the generating set contains carbon monoxide, using engine indoors **CAN KILL YOU!** NEVER use inside any building or any kind of enclosure, EVEN IF doors and windows are open. Place the generating set in a well-ventilated and clean area. Note the wind direction and air current when place the generating set.

High altitude

This generating set may require a high altitude carburetor kit to ensure correct operation at high altitudes. Consult the authorized local dealer for high altitude kit information if you always operate your engine at altitudes above 5,000 feet (1,500 meters).

CAUTION: Even with carburetor modification, generating set horsepower will decrease about 3.5% for each 1,000 feet (300 meters) increase in altitude. The effect of altitude on horsepower will be greater than this if no carburetor modification is made.

Operation the engine at altitude below 5,000 feet (1,500 meters) with modified carburetor may cause the generating set to overheat and result in serious engine damage. Please restore factory specifications of the carburetor at the dealer when using the engine in a low altitude area.

2. Operating Condition

Check for loose or damaged parts, signs of oil or fuel leaks, and any other condition that may affect proper operation. Repair or replace all damaged or defective parts immediately.

WARNING: Failing to correct problem(s) before operation could result in property damage, serious injury or DEATH.

Clean the dirt or foreign objects on the surface around exhaust and air intake of generator. DO NOT move or tip the generating set during operation. Use generating set only for intended uses. If you have questions about intended use, ask your local dealer.

3. Engine oil check

WARNING: This engine is not filed with oil before send out to the factory. User must add the proper amount of oil before operating the generator for the first time. Any attempt to crank or start the engine before it has been properly filled with the recommended type and amount of oil may result in engine damage and void your warranty. The oil capacity (rated) of the engine crankcase is 20.3 fl. oz.

ENGINE OIL RECOMMENDATIONS

Only use 4-stroke engine oil of SJ,SL or equivalent level which are in accordance with or higher than API standard.

Check the API label on oil bottle or other container, and make sure the “SJ,SL” or equivalent level letter is in the label.

SAE 10W-30 is recommended for general, all-temperature use. Other viscosities shown in the chart may be used when the average temperature in your area is within the indicated range.

Ambient Temperature

- Place the engine on a level surface with engine stopped. Check the engine oil level. Remove the oil maintenance cover. Remove the dipstick and wipe it clean.

- Reinstall dipstick into hole, rest on oil fill neck, DO NOT thread cap into hole.
- Remove the dipstick again and check oil level. Level should be between the upper and lower limit.
- Fill to the upper limit of the dipstick with the recommended oil if the oil level is too low.

- Reinstall and fully tighten the dipstick.

CAUTION: Operate generator only on a level surfaces. The engine is equipped with a low oil sensor (applicable types) that will automatic stop the engine when the oil level falls below the safe limit. To avoid the inconvenient of an unexpected shutdown, fill to the upper limit and check the oil level regularly.

4. Generating set fuel check

WARNING: This generator may emit highly flammable and explosive gasoline vapors, which can cause severe burns or even death if ignited. A nearby open flame can lead to explosion even if not directly in contact with gasoline.

With the engine stopped, check the fuel level. Refill the fuel tank if necessary. Use clean, fresh, regular unleaded gasoline with a minimum octane rating of 87. Do not mix oil with gasoline. Always wipe up any spilled fuel.

To add gasoline, follow these steps:

- Make sure the generator stopped and it is on a level surface.
- Unscrew fuel cap and set aside.

NOTE: The fuel cap may be tight and hard to unscrew.
- Slowly add unleaded gasoline to the fuel tank. Be sure not to fill above the upper limit mark. Always allow room for fuel expansion. The capacity of the fuel tank is 1.9 gallons .

NOTE: Do not fill the fuel tank to the very top. Gasoline will expand and spill over during use even with the fuel cap in place.
- Reinstall fuel cap and wipe clean any spilled gasoline with a dry cloth.

IMPORTANT:

- Do not fill tank indoors.
- Do not fill tank when the engine is running or hot.
- Never use an oil/gasoline mixture.
- Never use old gasoline.
- Avoid getting dirt or water into the fuel tank.

- Gasoline can age in the tank and make starting difficult. Never store generator for extended periods of time with fuel in the tank or the carburetor.
- Turn the fuel cock off and drain the fuel from the carburetor.

CAUTION:

- Never use engine or carburetor cleaner products in the fuel tank or permanent damage may occur.
- It is important to prevent gum deposits from forming in essential fuel system parts, such as the carburetor, fuel filter, fuel hose or tank during storage. Also, experience indicates that alcohol-blended fuels (called gasohol, ethanol or methanol) can attract moisture, which leads to separation and formation of acids during storage. Acidic fuel can damage the fuel system of the generating set while in storage. Be sure to review the instruction given in “Storage” section.
- Gasoline/ Alcohol Blends: up to 10% alcohol, 90% unleaded gasoline by volume is approved as a fuel. Other gasoline/alcohol blends are not approved.
- Effects of old, stale or contaminated fuel are not warrantable.
- Allow the generating set to cool for at least two minutes before removing fuel cap when adding fuel. Loosen the fuel cap slowly to relieve any pressure in the tank.

5. Generating set grounding

DANGER: Failure to properly ground the generator can result in electrocution.

The generator must be properly connected to an appropriate ground. It helps prevent electrical shock if a ground fault condition exists in the generating set or in connected electrical devices, especially when the unit is equipped with a wheel kit. Proper grounding also helps dissipate static electricity, which often builds up in ungrounded devices.

A ground terminal has been provided on the generating set. For remote grounding, connect a length of heavy gauge(4mm²) copper wire between the generating set ground terminal and a copper rod driven into the ground.

Local electrical codes may also require proper grounding of the unit. We strongly recommend that you consult with a qualified electrician for grounding requirements in your area.

ELECTRICAL DEVICES

Disconnect all electrical devices from the generator and switch off the AC circuit breaker before start the engine.

The generator may be hard to start with electrical devices.

The connected electrical equipment must not exceed the maximum limit of the generator. Please refer to the specification table for details.

NOTE: After completing the above preparation, the generator is ready to be started.

6. Battery connection

Remove the battery maintenance cover, connect the battery terminal to the motor terminal, and reinstall the maintenance cover.

STARTING THE GENERATOR

CAUTION: Disconnect all electrical loads from the generator before attempting to start.

Pull the starter handle 6-8 times to prefill fuel system before initial operation or removal from long term storage. Failure to do so could result in bad starting experience.

1. Perform generator preparation (see page 13) and remove all loads.
2. Turn the ventilation knob of fuel cap to the “ON” position to ensure fuel flow.

Electric starting:

- Turn the combination switch to “RUN” position.
- Press the engine switch and release it after the engine starts.

NOTE: If it fails to start, release the switch. The unit will restart by itself. If it fails to start after repeated 5 times, please allow the generator to cool for 1 minute and start again.

CAUTION: Never continue to start the generator without removing the fault. It's forbidden to start the generator after changing to another battery without

authorization.

If after three attempts to start, the generator still fails to start or stops after starting, please search and solve the fault.

Manual starting:

Cold start

Turn the combination switch to “CHOKE” position to shut off the choke.

Warm start

Turn the combination switch to “RUN” position, if not started, please turn the combination switch to “CHOKE” position before restarting.

Manual start

WARNING: Check starter cord conditions before operating. Have it replaced immediately by local authorized dealer if cord is frayed.

- When starting engine, grasp the recoil starter handle and pull slowly until resistance is felt. Then pull rapidly to avoid kickback. When pulling the recoil starter, Firmly grasp the generator to avoid tumble of generator or personal injury caused by tumble.

WARNING: KICKBACK

Rapid retraction of the starter cord will pull hand and arm towards the engine faster than you can let go. Unintentional startup can result in entanglement, traumatic amputation or laceration. Broken bones, fractures, bruises or sprains could result.

- Turn the combination switch to “RUN” position.

USING THE GENERATOR

When electric device requires a large starting current, please put the energy-saving switch in the “OFF” position. When the starting current required by electrical device is small. Put the energy-saving switch in the “ON” position.

After completing the operations above, the generator can be connected to electrical devices.

WARNING: It is prohibited to start or close the generating set when the output terminal of generating set is connected to an electric device is in “ON” state.

CONNECT TO ELECTRICAL DEVICES

1. Inspect power cord for damage before using. There is a hazard of electrical shock from crushing, cutting or heat damage.
2. Make sure that the generating set has been properly grounded. If the electric devices require grounding, the generating set must ground.
3. Make sure that the electric devices are in “OFF” position.
4. Allow the engine to stabilize and warm up for a few minutes after starting.
5. Connect and start the electric devices.
6. Turn off all electric devices and disconnect them from the generating set.
7. If the generating set supplies for several loads or electric devices, start the smallest one first and the largest one last.

DANGER: If connected devices overheat, turn them off and disconnect them from generating set.

Electrical Shock

To reduce the risk of electrical shock, DO NOT use electrical cords that are worn, frayed, bare or otherwise damaged. DO NOT touch bare wires or receptacles. DO NOT handle generating set or electrical cords while standing in water, while barefoot, or while hands or feet are wet.

LOADING CAPACITY

WARNING: Do not overload the generating set. Exceeding the generating set’s capacity can damage the generating set and/or electric devices connected to it.

You must make sure your generating set can supply enough rated (running) and (starting) watts for the electrical devices at the same time. Follow these simple steps to calculate the running and starting watts necessary for your purposes.

1. Count the electrical devices you will power at the same time.
2. The amount of power you need to run with the devices is the total rated (running) watts of these items.
3. Starting power is the power needed shortly when electric devices start. Since not all devices start at the same time, starting power can be estimated by the maximum power of all devices plus the total power counted in step 2.

Electric equipment		Rate power(W)	Starting power(W)
Appliances	Tablet TV 27"	80	100
	Energy saving lamb	5-50	5-50
	Electric cooker	1000	1000
	Computer	250	250
	Electric fan	50	100
	Washing machine	250	500
	Refrigerator	50	300
	Air-conditioner	1600	3200
Electric tooling	Electric hammer	1000	1500
	Impact Hammer	3000	6000
	Water pump	2200	5000
	Electric welding machine	5000	7500
	Air compressor	5000	10000

Wattage Reference Chart

WARNING: It is necessary to equip with circuit protector or switch to isolate the generating set from the electric utility when the generating set is mainly used for backup. Failure to isolate the generating set from the power utility may result in injury or death to electric utility workers and damage to the generating set due to back feed of electrical energy.

PARALLEL OPERATION

Make sure that the generating set is in a good running state before connecting it to other generating sets. The total power of electric devices should not exceed rated power of generating set. When electric motor starts, the overload indicator (red) will light up and normally it will stop within 4 seconds. If it cannot stop, please call (800) 791-9458 & (888)-293-0024 Mon-Fri 9-5 EST or email: support@powersmartusa.com & support@amerisuninc.com for customer service.

During parallel operation, energy-saving switches of generating sets should be in the same position. To parallel operation, perform the following steps:

1. Connect one generating set to other generating set(s) in parallel. Use the parallel kit to make the parallel connection (the parallel kit needs to be purchased separately).
2. Insert the plug of the parallel kit into the parallel socket on the panel, and start the generators in turn. Make sure that the output indicator of each generator is in normal state (green).
3. Connect the plug of electric devices to the AC receptacle of parallel kit.
NOTE: When connecting, please connect the plug to the panel socket of the same color.
4. Run the electric devices.

CAUTION: The total power of electric devices cannot exceed the rated power of generating set. The manufacturers of electric devices or tools always list the rated power of similar models or serial number.

When slightly overload, the load indicator flashes continuously, which may shorten the service life of the generating set. When severe overload, the load indicator light keeps on, which may cause damage to the generating set.

STOPPING THE GENERATOR

WARNING: Never stop the engine with electrical devices connected and with the connected devices turn “ON”.

1. Remove the connectors of all electric equipment from the generating set panel.
2. Turn the combination switch to “STOP” position, the generator stops operation.

MAINTENANCE

It is the operator’s responsibility to complete all scheduled maintenance in a timely manner. Correct any issue before operating the generating set. Always follow the inspection and maintenance recommendations and schedules in this manual.

WARNING: Improper maintenance or failure correct a problem before operation can cause a malfunction and result in property damage, serious injury or DEATH. Improper maintenance will void your warranty.

DANGER: Accidental starts can cause severe injury or death. Remove the spark plug cap and ground generating set before performing any service.

WARNING: The filter element may contains PAHs, PAHs are harmful for your health. Please wear gloves for protection during air filter maintenance.

MAINTENANCE SCHEDULE

Stop the generating set before serving, disconnect all electric devices and battery (If equipped), and cool down the generating set completely.

GENERATING SET MAINTENANCE

WARNING: Never clean the generator when it is running! Never use water to clean the generating set. Water can enter the generating set through the cooling slots and damage the generating set windings.

WARNING: Do not modify the generator in any way. Do not tamper with governed speed. Generator supplies correct rated frequency and voltage when running at factory set. Tampering with the factory set governor will void your warranty.

- Make certain that the generator is kept clean and stored properly.
- Use a damp cloth to clean exterior surfaces of the generating set. Use a soft brush to clean the dirt and oil.
- Use an air compressor (25 PSI) to clear dirt and debris from the generating set.
- Inspect all air vents and cooling slots to ensure that they are clean and unobstructed.

ENGINE MAINTENANCE

Changing the oil

WARNING: Change the oil when the engine is warm from operation. The oil can reach up to 140 °C under that condition. Careful operation should be taken to prevent burns.

1. Place the machine on a level surface which is 300mm higher than the ground.
2. Remove the air filter maintenance cover.

3. Remove the oil drain plug.

4. Place the oil container box under the oil drain hole of the generator and remove the drain bolt to drain out all the used oil.

- Fully tighten the drain bolt before reinstalling the drain plug.
- Add recommended oil to the upper limit.

- Fully tighten the dipstick and install the air filter maintenance cover back in place.
- Properly dispose of any used oil at an approved waste management facility.

AIR FILTER

WARNING: Do not run the engine without the air filter, or serious danger can result.

Routine maintenance of the air cleaner helps maintain proper airflow to the carburetor. Occasionally check that the air cleaner is free of excessive dirt.

- Remove the air filter maintenance cover.
- Loose the filter fix clamp and remove the cover of the air filter.
- Remove the foam filter element.
- Wash in liquid detergent and warm water.
- Squeeze thoroughly dry in a clean cloth.
- Saturate in clean engine oil.
- Squeeze in a clean , absorbent cloth to remove all excess oil.
- Assemble the filter element onto the filter unit.
- Assemble the filter fix clamp.
- Reinstall the air filter maintenance cover.

SPARK PLUG

Spark plug gap : 0.6mm-0.8mm(0.024-0.031 in). Spark plug tighten torque: 15-20N.m

The spark plug is important for proper engine operation. A good spark plug should be intact, free of deposits, and properly gapped. Refer to Recommended Maintenance Schedule. To inspect the spark plug:

- Remove the maintenance cover of spark plug.
- Remove the spark plug cap.
- Using socket wrench to loose and remove the spark plug.
- Inspect the spark plug and spark plug washer, if it was broken or worn, replace with a new one.Clean the spark plug with wire brush if reuse it.
- Check spark plug gap. Carefully bend side electrode to adjust the gap if necessary.
- Carefully thread the plug into the engine by hand.
- After the spark plug is seated, use spark plug wrench to tighten the plug.
- Attach the spark cap to the plug and connect the spark plug wire to the plug.
- Install spark plug maintenance cover.

CAUTION: Only use recommended spark plug or equivalent. Do not use spark plugs that have improper heat range.

SPARK ARRESTER

1. Allow the generating set to cool completely before servicing the spark arrester.
2. Remove the muffler blind window first.
3. Remove the spark arrester screen.
4. Carefully remove the carbon deposits from the spark arrester screen with a wire brush.
5. Replace the spark arrester if it is damaged.
6. Reinstall the spark arrester in the muffler and reinstall the muffler blind window.

STORAGE & TRANSPORT PROCEDURES

STORAGE

WARNING: Gasoline is highly flammable and extremely explosive. Empty the fuel tank and shut off fuel valve before storing or transporting this generating set.

The generating set should be started at least once every 2 weeks and allowed to run for at least 20 minutes. Follow the instructions below for longer term storage if the generating set will be out of service for 2 months or more.

- Allow the generating set to cool completely before storage.
- Clean the generating set according to instruction in maintenance section.
- Drain all fuel completely from the fuel tank, fuel hose and carburetor to prevent gum from forming.
- Turn off the fuel supply at the fuel valve.
- Change the oil.
- Reattach the spark plug.
- Remove the spark plug and pour about 15ml of oil into the cylinder. Crank the engine slowly to distribute the oil and lubricate the cylinder.
- Store the unit in a clean, dry area out of direct sunlight.

TRANSPORT

To prevent fuel spillage when transporting or during temporary storage, the generating set should be secured upright in its normal operating position, with the engine switch OFF. The fuel valve lever should be turned OFF.

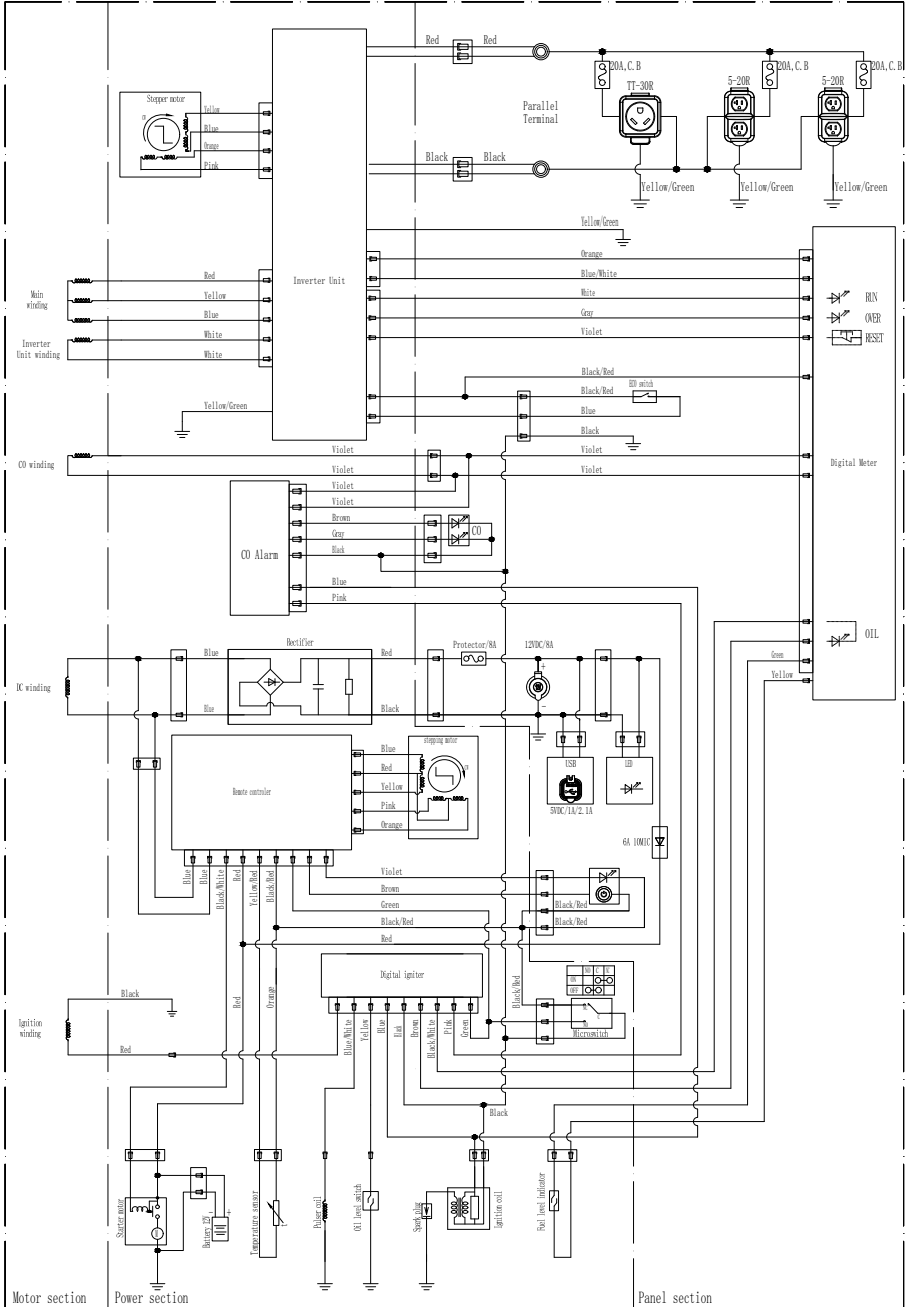

When transporting:

- Do not overfill the tank.
- Do not operate the generating set while it is on vehicle. Take the generating set off the vehicle and use it in a well-ventilated place. Avoid a place exposed to direct sunlight when putting the generating set on a vehicle. If the generating set is left in an enclosed vehicle for many hours, high temperature inside the vehicle could cause fuel to vaporize resulting in a possible explosion.
- Do not drive on a rough road for an extended period with the generating set on a rough road, drain the fuel from the generating set beforehand.

TROUBLESHOOTING

Failure	Trouble	Solution
Generating set fails to start	Combination switch is in "OFF" or "STOP" position.	When engine is cold, turn switch to "CHOKE", and follow starting procedure to start the generating set. When engine is hot, turn switch to "RUN", and follow starting procedure to start the generating set.
	Lack of fuel.	Fill fuel tank per instructions in this manual.
	Lack of engine oil.	Check oil level. This engine is equipped with a low oil sensor. The engine cannot be started unless the oil level is above the prescribed lower limit.
	No ignition.	Remove the spark plug cap. Clean any dirt around the plug base, and then remove the spark plug. Install the spark plug in the plug cap. Turn the combination switch to "RUN" position. Grounding the electrode to any engine ground, pull the recoil starter to see if sparks jump across the gap. If there is no spark, replace the plug. Reinstall the plug and start engine according to instructions in this manual. Consult Customer Service if necessary.
	Spark plug is splashed by fuel	Remove the spark plug and wipe the fuel.
	The generating set flames out after running for a certain time.	Turn the ventilation knob on the fuel tank cap to "ON" position; Check the fuel and oil level. Add them if necessary.
	Battery undercharge (electric start)	Charge the battery by starting the generator manually (at least 30 minutes). After closing the choke manually, start the generator according to the manual startup steps.
Generating set has no output	Breaker trip	Reset circuit breakers.
	Inadequate cord sets or extension cords.	Check cord sets or extension cords capabilities in section controls; cable size in this manual. Consult Customer Service if necessary.
