

GERMAN CHRISTMAS PYRAMIDS

Instructions

STEP 1) Thread the tall metal rod vertically through the centre of the pyramid.

STEP 2) Push on the triangular wooden piece with pre-drilled holes onto the top of the protruding metal rod.

STEP 3) Place fins in pre drilled holes all slanting at the same angle to enable better airodynamics.

STEP 4) Place candle holders around base of pyramids (They should slot into pre designed holes at the bse of the pyramid).

STEP 5) Get your tall thin candles and see whether they fit into the gold dishes that are located on each candle holder.

If your **candles are slightly too big** you will need to gently shave the bottom of each candle so its tapered.

If you **candles are too small** in diameter you will need to melt hot wax into the dish and quickly place the candle into the pile of hot wax to secure the base.

STEP 5) Light each candle around the base. Once the candles produce enough heat the fan should turn. Make sure the fan turns freely before walking away from the pyramid otherwise the fins might burn if not able to rotate from the rising heat. If the fan doesn't spin check that the rod is sitting centrally and not caught on any figurines.

** The speed of the fan will vary with heat. The closer the candles to the fan the faster it will turn.
