EUROPA TOOL · Clarkson · sborn

●: Excellent ○: Good

SUPERIOR PERFORMANCE

HIGH FEED
SHORT AND LONG

Heavy core with reduced diameter allows greater depths and maximum rigidity.

Nano grain carbide substrate and high heat resistant coating for increased tool life in dry machining applications.

Extra short flute length for high rigidity.

Reduced clearance angles and short flutes to strengthen corner radius and reduce chattering.

IDEAL FOR MATERIAL GROUPS

P H

PULSAR BLUE
END MILLS

Designed specifically for use in dry cutting conditions

4 FLUTE HIGH FEED CORNER RADIUS SHORT LENGTH

NG | BLUE | FLUTE 4 | R ±0.005

Series No. 110350

▶ cutting conditions : p.38-39

Excellent wear resistance at heavy feed rates on high hardened material.
Designed with reduced clearance angles and short flutes for strength.
High hardness & heat resistant coating for long life in dry applications.

PULSAR BLUE DESIGNED SPECIFICALLY FOR USE IN DRY CUTTING CONDITIONS

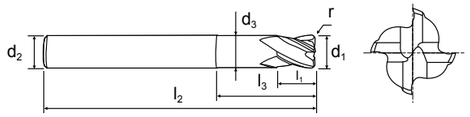
4 FLUTE CORNER RADIUS EXTENDED NECK LONG LENGTH

NG | 30° | BLUE | FLUTE 4 | R ±0.010 < ø 6.0 | R ±0.015 > ø 6.0 | PLAIN



Series No. 101750

▶ cutting conditions : p.47

Designed to machine high hardened materials
Suitable for dry cutting, high speed cutting.
Excellent workpiece finish.
Designed for deep slotting.
Higher wear-resistance.

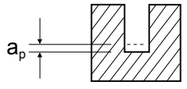
	64		f (mm/min)	285	490	585	790	1035	1045	1000



▶ The data shown is based on medial length tools. Please adjust machining conditions according to length.

v_c - cutting speed (m/min)
n - RPM (rev/min)
f_Z - feed rate (mm/tooth)
f - feed rate (mm/rev)
z - No. of teeth
a_p - axial depth of cut
a_e - radial depth of cut

To calculate RPM from cutting speed: $n = \frac{v_c * 1000}{\pi * ø}$

To calculate cutting speed from RPM: $v_c = \frac{n * \pi * ø}{1000}$

All recommendations are based on ideal machining conditions. Adjustments may need to be made according to your set-up. The recommendations for speeds, feeds and other parameters presented in this chart are nominal recommendations and should be considered only as good starting points.

▶ The data shown is based on medial length tools. Please adjust machining conditions according to length.

v_c - cutting speed (m/min)
n - RPM (rev/min)
f_Z - feed rate (mm/tooth)
f - feed rate (mm/rev)
z - No. of teeth
a_p - axial depth of cut
a_e - radial depth of cut

To calculate RPM from cutting speed: $n = \frac{v_c * 1000}{\pi * \varnothing}$

To calculate cutting speed from RPM: $v_c = \frac{n * \pi * \varnothing}{1000}$

All recommendations are based on ideal machining conditions. Adjustments may need to be made according to your set-up. The recommendations for speeds, feeds and other parameters presented in this chart are nominal recommendations and should be considered only as good starting points.

v_c - cutting speed (m/min)
n - RPM (rev/min)
f_Z - feed rate (mm/tooth)
f - feed rate (mm/rev)
z - No. of teeth
a_p - axial depth of cut
a_e - radial depth of cut

To calculate RPM from cutting speed: $n = \frac{v_c * 1000}{\pi * \varnothing}$

To calculate cutting speed from RPM: $v_c = \frac{n * \pi * \varnothing}{1000}$

All recommendations are based on ideal machining conditions. Adjustments may need to be made according to your set-up. The recommendations for speeds, feeds and other parameters presented in this chart are nominal recommendations and should be considered only as good starting points.

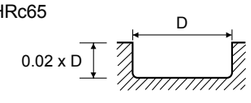
> HRc65



v_c - cutting speed (m/min)
n - RPM (rev/min)
f_Z - feed rate (mm/tooth)
f - feed rate (mm/rev)
z - No. of teeth
a_p - axial depth of cut
a_e - radial depth of cut

To calculate RPM from cutting speed: $n = \frac{v_c * 1000}{\pi * ø}$

To calculate cutting speed from RPM: $v_c = \frac{n * \pi * ø}{1000}$

All recommendations are based on ideal machining conditions. Adjustments may need to be made according to your set-up. The recommendations for speeds, feeds and other parameters presented in this chart are nominal recommendations and should be considered only as good starting points.

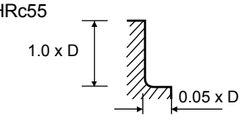
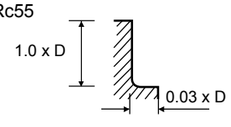
< HRc55



> HRc55



▶ The data shown is based on medial length tools. Please adjust machining conditions according to length.

v_c - cutting speed (m/min)
n - RPM (rev/min)
f_Z - feed rate (mm/tooth)
f - feed rate (mm/rev)
z - No. of teeth
a_p - axial depth of cut
a_e - radial depth of cut

To calculate RPM from cutting speed: $n = \frac{v_c * 1000}{\pi * ø}$

To calculate cutting speed from RPM: $v_c = \frac{n * \pi * ø}{1000}$

All recommendations are based on ideal machining conditions. Adjustments may need to be made according to your set-up. The recommendations for speeds, feeds and other parameters presented in this chart are nominal recommendations and should be considered only as good starting points.

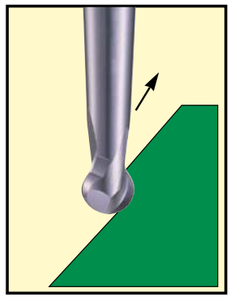
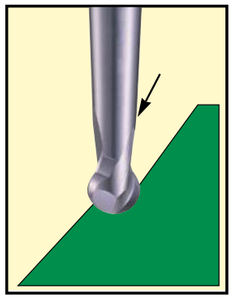
ADVANCED TECHNIQUE



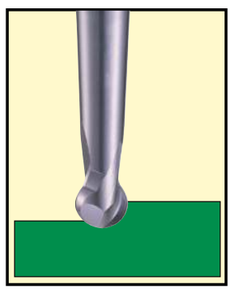
Favorable Back Milling

NORMAL TECHNIQUE

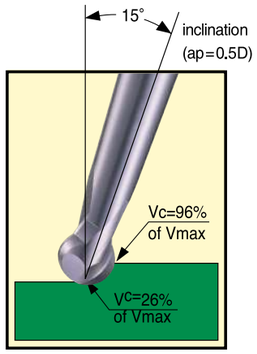


Normal Ball Nose

- Operating angle 14° ~ 16°, higher speed and feed are possible, as cutting resistance at the cutting edges is reduced.
- Excellent surface roughness and more secure milling process.
- Higher speed and feed rates are achievable when back milling.



Normal Ball Nose



Favorable Profiling

- Using 15º inclined profiling operation, increased productivity and higher speed and feed are possible.
- Decreased cutting force.
- Excellent surface roughness and finish.

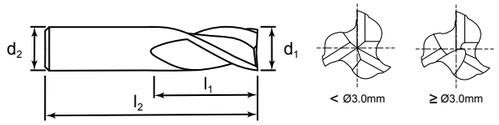
3 FLUTE MINIATURE

MG < .5㎛ | 30° | N | FLUTE 3 | PLAIN | FLAT



Series No. 103120, 103320

▶ cutting conditions : p.110-111

The miniature end mill is universally adopted as the most cost effective system for small milling cutters and has the advantages of 2 flute and 4 flute end mills.

▶ The data shown is based on medial length tools. Please adjust machining conditions according to length.

v_c - cutting speed (m/min)
n - RPM (rev/min)
f_Z - feed rate (mm/tooth)
f - feed rate (mm/rev)
z - No. of teeth
a_p - axial depth of cut
a_e - radial depth of cut

To calculate RPM from cutting speed: $n = \frac{v_c * 1000}{\pi * ø}$

To calculate cutting speed from RPM: $v_c = \frac{n * \pi * ø}{1000}$

All recommendations are based on ideal machining conditions. Adjustments may need to be made according to your set-up. The recommendations for speeds, feeds and other parameters presented in this chart are nominal recommendations and should be considered only as good starting points.

v_c - cutting speed (m/min)
n - RPM (rev/min)
f_Z - feed rate (mm/tooth)
f - feed rate (mm/rev)
z - No. of teeth
a_p - axial depth of cut
a_e - radial depth of cut

To calculate RPM from cutting speed: $n = \frac{v_c * 1000}{\pi * ø}$

To calculate cutting speed from RPM: $v_c = \frac{n * \pi * ø}{1000}$

All recommendations are based on ideal machining conditions. Adjustments may need to be made according to your set-up. The recommendations for speeds, feeds and other parameters presented in this chart are nominal recommendations and should be considered only as good starting points.

v_c - cutting speed (m/min)
n - RPM (rev/min)
f_z - feed rate (mm/tooth)
f - feed rate (mm/rev)
z - No. of teeth
a_p - axial depth of cut
a_e - radial depth of cut

To calculate RPM from cutting speed: $n = \frac{v_c * 1000}{\pi * ø}$

To calculate cutting speed from RPM: $v_c = \frac{n * \pi * ø}{1000}$

All recommendations are based on ideal machining conditions. Adjustments may need to be made according to your set-up. The recommendations for speeds, feeds and other parameters presented in this chart are nominal recommendations and should be considered only as good starting points.

SUPERIOR PERFORMANCE

HEAVY CUT
4-FL MULTI HELIX

DMX high performance coating for increased tool life in dry machining and high speed applications.

Micro grain carbide substrate for increased toughness and hardness.

Multiple helix flute geometry >3.0mm for reduced wear and vibration.

Special gash land geometry on end teeth and protected corner to allow high depths of cut.

IDEAL FOR MATERIAL GROUPS

P H K

PULSAR DMX
END MILLS

Designed for high speed cutting of pre-hardened steels up to HRc55

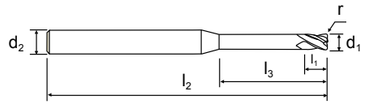
4 FLUTE EXTENDED NECK CORNER RADIUS

MG HM | M-HELIX ≥ ø 3.0 | FLUTE 4 | PLAIN | R ±0.02



Series No. 114365

▶ cutting conditions : p.166

New coating and new geometry give outstanding cutting ability and wear resistance.
Excellent performance in pre-hardened steels and alloy steels <HRc55.
Multiple helix geometry 3.0mm and above.

▶ The data shown is based on medial length tools. Please adjust machining conditions according to length.

v_c - cutting speed (m/min)
n - RPM (rev/min)
f_Z - feed rate (mm/tooth)
f - feed rate (mm/rev)
z - No. of teeth
a_p - axial depth of cut
a_e - radial depth of cut

To calculate RPM from cutting speed: $n = \frac{v_c * 1000}{\pi * ø}$

To calculate cutting speed from RPM: $v_c = \frac{n * \pi * ø}{1000}$

All recommendations are based on ideal machining conditions. Adjustments may need to be made according to your set-up. The recommendations for speeds, feeds and other parameters presented in this chart are nominal recommendations and should be considered only as good starting points.

▶ The data shown is based on medial length tools. Please adjust machining conditions according to length.

v_c - cutting speed (m/min)
n - RPM (rev/min)
f_Z - feed rate (mm/tooth)
f - feed rate (mm/rev)
z - No. of teeth
a_p - axial depth of cut
a_e - radial depth of cut

To calculate RPM from cutting speed: $n = \frac{v_c * 1000}{\pi * ø}$

To calculate cutting speed from RPM: $v_c = \frac{n * \pi * ø}{1000}$

All recommendations are based on ideal machining conditions. Adjustments may need to be made according to your set-up. The recommendations for speeds, feeds and other parameters presented in this chart are nominal recommendations and should be considered only as good starting points.

▶ The data shown is based on medial length tools. Please adjust machining conditions according to length.

v_c - cutting speed (m/min)
n - RPM (rev/min)
f_Z - feed rate (mm/tooth)
f - feed rate (mm/rev)
z - No. of teeth
a_p - axial depth of cut
a_e - radial depth of cut

To calculate RPM from cutting speed: $n = \frac{v_c * 1000}{\pi * \varnothing}$

To calculate cutting speed from RPM: $v_c = \frac{n * \pi * \varnothing}{1000}$

All recommendations are based on ideal machining conditions. Adjustments may need to be made according to your set-up. The recommendations for speeds, feeds and other parameters presented in this chart are nominal recommendations and should be considered only as good starting points.

f - feed rate (mm/rev)
z - No. of teeth
a_p - axial depth of cut
a_e - radial depth of cut

To calculate RPM from cutting speed: $n = \frac{v_c * 1000}{\pi * ø}$

To calculate cutting speed from RPM: $v_c = \frac{n * \pi * ø}{1000}$

All recommendations are based on ideal machining conditions. Adjustments may need to be made according to your set-up. The recommendations for speeds, feeds and other parameters presented in this chart are nominal recommendations and should be considered only as good starting points.

a_e - radial depth of cut

To calculate RPM from cutting speed: $n = \frac{v_c * 1000}{\pi * \varnothing}$

To calculate cutting speed from RPM: $v_c = \frac{n * \pi * \varnothing}{1000}$

All recommendations are based on ideal machining conditions. Adjustments may need to be made according to your set-up. The recommendations for speeds, feeds and other parameters presented in this chart are nominal recommendations and should be considered only as good starting points.

SUPERIOR PERFORMANCE

HX2
MULTI HELIX

Chatter free design allows for increased cutting depths and feed rates.

Premium grade carbide substrate and high heat resistant coating for increased tool life.

Multiple helix flute design for silent machining and excellent surface finish.

Unique sinusoidal flute geometry for reduced resonance vibration and smooth chip evacuation.

IDEAL FOR MATERIAL GROUPS

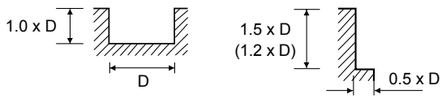
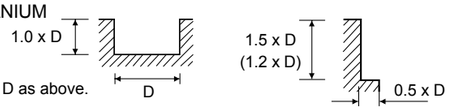
STEEL, STAINLESS STEEL, CAST IRON

1.2 x D axial cutting depth should be applied for short length tools above ø8mm

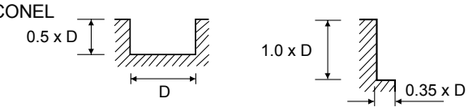


TITANIUM

1.2 x D as above.



INCONEL



▶ The data shown is based on medial length tools. Please adjust machining conditions according to length.

v_c - cutting speed (m/min)
n - RPM (rev/min)
f_Z - feed rate (mm/tooth)
f - feed rate (mm/rev)
z - No. of teeth
a_p - axial depth of cut
a_e - radial depth of cut

To calculate RPM from cutting speed: $n = \frac{v_c * 1000}{\pi * ø}$

To calculate cutting speed from RPM: $v_c = \frac{n * \pi * ø}{1000}$

All recommendations are based on ideal machining conditions. Adjustments may need to be made according to your set-up. The recommendations for speeds, feeds and other parameters presented in this chart are nominal recommendations and should be considered only as good starting points.

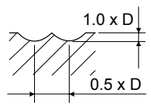
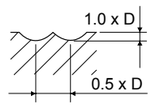
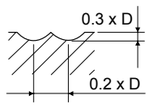
STEEL, STAINLESS STEEL, CAST IRON



TITANIUM



INCONEL



v_c - cutting speed (m/min)
n - RPM (rev/min)
f_Z - feed rate (mm/tooth)
f - feed rate (mm/rev)
z - No. of teeth
a_p - axial depth of cut
a_e - radial depth of cut

To calculate RPM from cutting speed: $n = \frac{v_c * 1000}{\pi * ø}$

To calculate cutting speed from RPM: $v_c = \frac{n * \pi * ø}{1000}$

All recommendations are based on ideal machining conditions. Adjustments may need to be made according to your set-up. The recommendations for speeds, feeds and other parameters presented in this chart are nominal recommendations and should be considered only as good starting points.

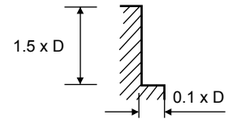
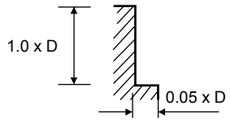
STEEL, STAINLESS STEEL, TITANIUM



INCONEL



v_c - cutting speed (m/min)
n - RPM (rev/min)
f_Z - feed rate (mm/tooth)
f - feed rate (mm/rev)
z - No. of teeth
a_p - axial depth of cut
a_e - radial depth of cut

To calculate RPM from cutting speed: $n = \frac{v_c * 1000}{\pi * ø}$

To calculate cutting speed from RPM: $v_c = \frac{n * \pi * ø}{1000}$

All recommendations are based on ideal machining conditions. Adjustments may need to be made according to your set-up. The recommendations for speeds, feeds and other parameters presented in this chart are nominal recommendations and should be considered only as good starting points.

SUPERIOR PERFORMANCE

3-FL NECKED
POLISHED FLUTE

Reduced diameter neck to allow multiple passes with no workpiece marking.

Mirror polished flutes for smooth chip evacuation.

Premium grade carbide substrate for increased tool life.

Corner protected to prevent chipping at high speeds.

IDEAL FOR MATERIAL GROUPS

N O

ALU-XP
END MILLS

Super mirror polished for Aluminium and other non-ferrous materials

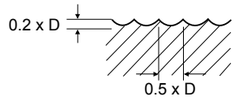
	74	f (mm/min)	1400	1600	1880	2400	2160	1760



v_c - cutting speed (m/min)
n - RPM (rev/min)
f_z - feed rate (mm/tooth)
f - feed rate (mm/rev)
z - No. of teeth
a_p - axial depth of cut
a_e - radial depth of cut

To calculate RPM from cutting speed: $n = \frac{v_c * 1000}{\pi * ø}$

To calculate cutting speed from RPM: $v_c = \frac{n * \pi * ø}{1000}$

All recommendations are based on ideal machining conditions. Adjustments may need to be made according to your set-up. The recommendations for speeds, feeds and other parameters presented in this chart are nominal recommendations and should be considered only as good starting points.

SUPERIOR PERFORMANCE

HX2S
MULTIPLE HELIX

Optimal roughing tooth profile allows for increased cutting depths and feed rates.

Special tool geometry designed for high feed rate and heavy cutting.

Premium grade carbide substrate and high heat resistant, custom engineered coating for increased tool life.

Unique sinusoidal flute geometry for reduced resonance vibration and smooth chip evacuation.

IDEAL FOR MATERIAL GROUPS

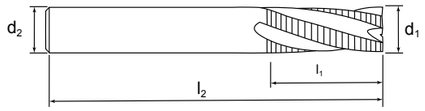
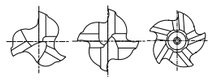
MULTIFLUTE SABRE LONG LENGTH FINE PITCH

PREMIUM PM | FLUTE 3-5 | DIN 844 | 30° | FINE | DIN 1835B | <Ø20 | >Ø20

Series No. 191140

▶ cutting conditions : p.270





Suitable for high feed roughing.
Designed for Steel, Stainless steel and Nickel alloys.
Sabre coating suitable for high speed cutting.
Centre cutting up to ø 20.0mm, non-centre cutting from ø 22.0mm.

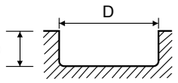
> HRc25



v_c - cutting speed (m/min)
n - RPM (rev/min)
f_Z - feed rate (mm/tooth)
f - feed rate (mm/rev)
z - No. of teeth
a_p - axial depth of cut
a_e - radial depth of cut

To calculate RPM from cutting speed: $n = \frac{v_c * 1000}{\pi * \varnothing}$

To calculate cutting speed from RPM: $v_c = \frac{n * \pi * \varnothing}{1000}$

All recommendations are based on ideal machining conditions. Adjustments may need to be made according to your set-up. The recommendations for speeds, feeds and other parameters presented in this chart are nominal recommendations and should be considered only as good starting points.

2 FLUTE DRILL MILL

MG HM | EUROPA STD | N | FLUTE 2 | 30° | DIN 6535HA

Series No. 197303

▶ cutting conditions : p.322-324

- Performs many drilling and milling operations not presently done with the standard end mill.
- Among the many vertical milling machine operations, the Drill Mill performs are :
Drilling, Slotting, NC Milling Drilling & Slotting, Profile Milling, Chamfering.

▶ The feed rate for long and long reach tools should be reduced by up to 50%

v_c - cutting speed (m/min)
n - RPM (rev/min)
f_Z - feed rate (mm/tooth)
f - feed rate (mm/rev)
z - No. of teeth
a_p - axial depth of cut
a_e - radial depth of cut

To calculate RPM from cutting speed: $n = \frac{v_c * 1000}{\pi * ø}$

To calculate cutting speed from RPM: $v_c = \frac{n * \pi * ø}{1000}$

All recommendations are based on ideal machining conditions. Adjustments may need to be made according to your set-up. The recommendations for speeds, feeds and other parameters presented in this chart are nominal recommendations and should be considered only as good starting points.

▶ The feed rate for long and long reach tools should be reduced by up to 50%

v_c - cutting speed (m/min)
n - RPM (rev/min)
f_Z - feed rate (mm/tooth)
f - feed rate (mm/rev)
z - No. of teeth
a_p - axial depth of cut
a_e - radial depth of cut

To calculate RPM from cutting speed: $n = \frac{v_c * 1000}{\pi * ø}$

To calculate cutting speed from RPM: $v_c = \frac{n * \pi * ø}{1000}$

All recommendations are based on ideal machining conditions. Adjustments may need to be made according to your set-up. The recommendations for speeds, feeds and other parameters presented in this chart are nominal recommendations and should be considered only as good starting points.

STEEL

a_p : ø3.0mm - ø6.0mm = 0.2 x D
a_p : ø8.0mm - ø25.0mm = 0.3 x D

CAST IRON, ALUMINIUM

▶ The feed rate for long and long reach tools should be reduced by up to 50%

v_c - cutting speed (m/min)
n - RPM (rev/min)
f_Z - feed rate (mm/tooth)
f - feed rate (mm/rev)
z - No. of teeth
a_p - axial depth of cut
a_e - radial depth of cut

To calculate RPM from cutting speed: $n = \frac{v_c * 1000}{\pi * ø}$

To calculate cutting speed from RPM: $v_c = \frac{n * \pi * ø}{1000}$

All recommendations are based on ideal machining conditions. Adjustments may need to be made according to your set-up. The recommendations for speeds, feeds and other parameters presented in this chart are nominal recommendations and should be considered only as good starting points.

			f (mm/min)	40	40	45	50	55	55	60	60	60

v_c - cutting speed (m/min)
n - RPM (rev/min)
f_Z - feed rate (mm/tooth)
f - feed rate (mm/rev)
z - No. of teeth
a_p - axial depth of cut
a_e - radial depth of cut

To calculate RPM from cutting speed: $n = \frac{v_c * 1000}{\pi * \varnothing}$

To calculate cutting speed from RPM: $v_c = \frac{n * \pi * \varnothing}{1000}$

All recommendations are based on ideal machining conditions. Adjustments may need to be made according to your set-up. The recommendations for speeds, feeds and other parameters presented in this chart are nominal recommendations and should be considered only as good starting points.

SUPERIOR PERFORMANCE

Clarkson

COARSE PITCH
ROUGHING/FINISHING

Truncated knuckle form for use in roughing and finishing operations.

Premium grade HSSCo8 substrate for increased tool life. TiAlN coating available to order.

3 to 6 flute depending on diameter.

Centre cutting up to 20.0mm, can be used for plunging.

IDEAL FOR MATERIAL GROUPS

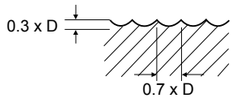
	73		f_z	0.01	0.016	0.025	0.044	0.056	0.068	0.075	0.088	0.096
			f (mm/min)	230	260	280	350	360	340	300	280	250



- The feed rate for long and long reach tools should be reduced by up to 50%
- The speeds and feeds for TiAlN coated tools can be increased by up to 30%

v_c - cutting speed (m/min)
n - RPM (rev/min)
f_Z - feed rate (mm/tooth)
f - feed rate (mm/rev)
z - No. of teeth
a_p - axial depth of cut
a_e - radial depth of cut

To calculate RPM from cutting speed: $n = \frac{v_c * 1000}{\pi * ø}$

To calculate cutting speed from RPM: $v_c = \frac{n * \pi * ø}{1000}$

All recommendations are based on ideal machining conditions. Adjustments may need to be made according to your set-up. The recommendations for speeds, feeds and other parameters presented in this chart are nominal recommendations and should be considered only as good starting points.

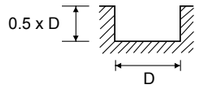
			f (mm/min)	350	350	320	300	280	270	270	240



- The feed rate for long and long reach tools should be reduced by up to 50%
- The speeds and feeds for TiAlN coated tools can be increased by up to 30%

v_c - cutting speed (m/min)
n - RPM (rev/min)
f_Z - feed rate (mm/tooth)
f - feed rate (mm/rev)
z - No. of teeth
a_p - axial depth of cut
a_e - radial depth of cut

To calculate RPM from cutting speed: $n = \frac{v_c * 1000}{\pi * ø}$

To calculate cutting speed from RPM: $v_c = \frac{n * \pi * ø}{1000}$

All recommendations are based on ideal machining conditions. Adjustments may need to be made according to your set-up. The recommendations for speeds, feeds and other parameters presented in this chart are nominal recommendations and should be considered only as good starting points.

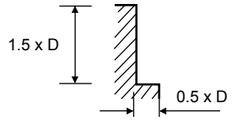
			f (mm/min)	470	450	510	530	500	470	450	370



- The feed rate for long and long reach tools should be reduced by up to 50%
- The speeds and feeds for TiAlN coated tools can be increased by up to 30%

v_c - cutting speed (m/min)
n - RPM (rev/min)
f_Z - feed rate (mm/tooth)
f - feed rate (mm/rev)
z - No. of teeth
a_p - axial depth of cut
a_e - radial depth of cut

To calculate RPM from cutting speed: $n = \frac{v_c * 1000}{\pi * \varnothing}$

To calculate cutting speed from RPM: $v_c = \frac{n * \pi * \varnothing}{1000}$

All recommendations are based on ideal machining conditions. Adjustments may need to be made according to your set-up. The recommendations for speeds, feeds and other parameters presented in this chart are nominal recommendations and should be considered only as good starting points.

- The feed rate for long and long reach tools should be reduced by up to 50%
- Data shown is for HSSCo tools. Reduce feed rates by up to 20% for HSS tools.

v_c - cutting speed (m/min)
n - RPM (rev/min)
f_Z - feed rate (mm/tooth)
f - feed rate (mm/rev)
z - No. of teeth
a_p - axial depth of cut
a_e - radial depth of cut

To calculate RPM from cutting speed: $n = \frac{v_c * 1000}{\pi * ø}$

To calculate cutting speed from RPM: $v_c = \frac{n * \pi * ø}{1000}$

All recommendations are based on ideal machining conditions. Adjustments may need to be made according to your set-up. The recommendations for speeds, feeds and other parameters presented in this chart are nominal recommendations and should be considered only as good starting points.

▶ The feed rate for long and long reach tools should be reduced by up to 50%

v_c - cutting speed (m/min)
n - RPM (rev/min)
f_Z - feed rate (mm/tooth)
f - feed rate (mm/rev)
z - No. of teeth
a_p - axial depth of cut
a_e - radial depth of cut

To calculate RPM from cutting speed: $n = \frac{v_c * 1000}{\pi * ø}$

To calculate cutting speed from RPM: $v_c = \frac{n * \pi * ø}{1000}$

All recommendations are based on ideal machining conditions. Adjustments may need to be made according to your set-up. The recommendations for speeds, feeds and other parameters presented in this chart are nominal recommendations and should be considered only as good starting points.

- The feed rate for long and long reach tools should be reduced by up to 50%
- Data shown is for HSSCo tools. Reduce feed rates by up to 20% for HSS tools.

v_c - cutting speed (m/min)
n - RPM (rev/min)
f_Z - feed rate (mm/tooth)
f - feed rate (mm/rev)
z - No. of teeth
a_p - axial depth of cut
a_e - radial depth of cut

To calculate RPM from cutting speed: $n = \frac{v_c * 1000}{\pi * ø}$

To calculate cutting speed from RPM: $v_c = \frac{n * \pi * ø}{1000}$

All recommendations are based on ideal machining conditions. Adjustments may need to be made according to your set-up. The recommendations for speeds, feeds and other parameters presented in this chart are nominal recommendations and should be considered only as good starting points.

SUPERIOR PERFORMANCE

Clarkson

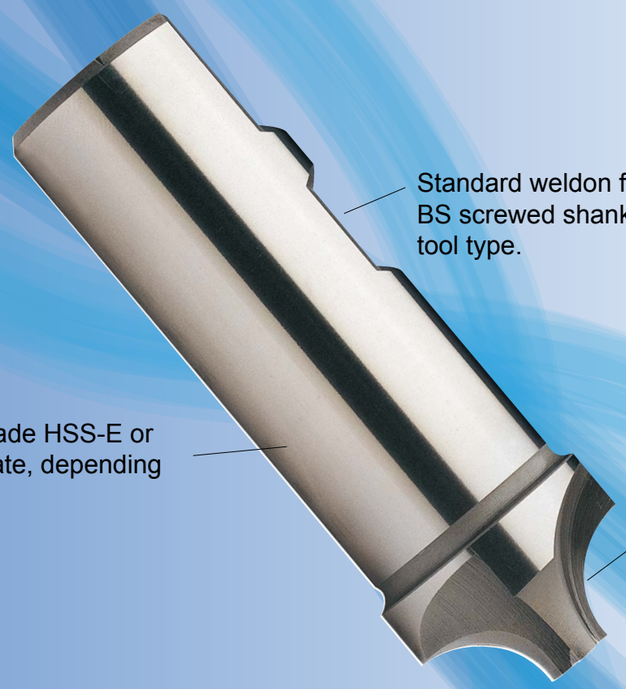
FORM TOOLS
HSS-E & HSS



Standard weldon flatted shank or BS screwed shank, depending on tool type.

Premium grade HSS-E or HSS substrate, depending on tool type.

Dovetail, Woodruff, T-Slot and Corner Radius forms available.

Tools can be coated to extend tool life if required.

IDEAL FOR MATERIAL GROUPS

P N

APPLICATION FORM CUTTERS

v_c - cutting speed (m/min)
n - RPM (rev/min)
f_z - feed rate (mm/tooth)
f - feed rate (mm/rev)
z - No. of teeth
a_p - axial depth of cut
a_e - radial depth of cut

To calculate RPM from cutting speed: $n = \frac{v_c * 1000}{\pi * ø}$

To calculate cutting speed from RPM: $v_c = \frac{n * \pi * ø}{1000}$

All recommendations are based on ideal machining conditions. Adjustments may need to be made according to your set-up. The recommendations for speeds, feeds and other parameters presented in this chart are nominal recommendations and should be considered only as good starting points.

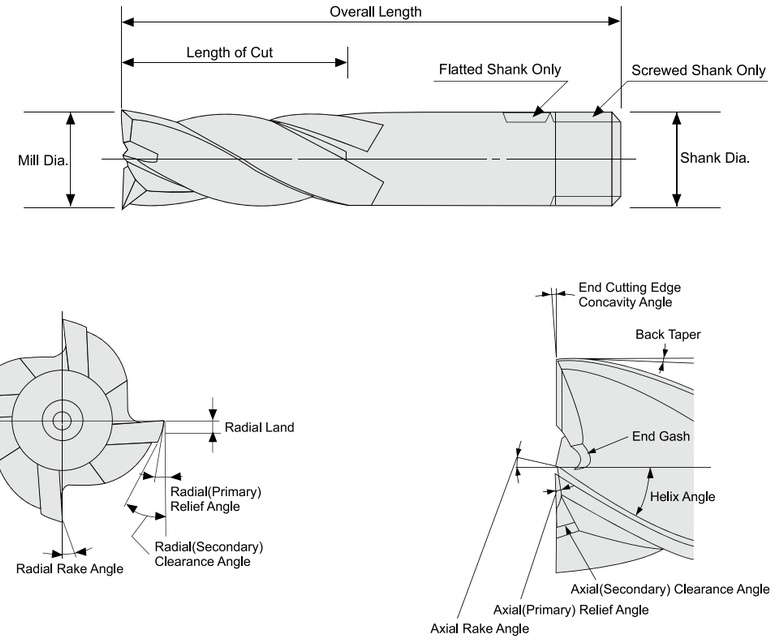
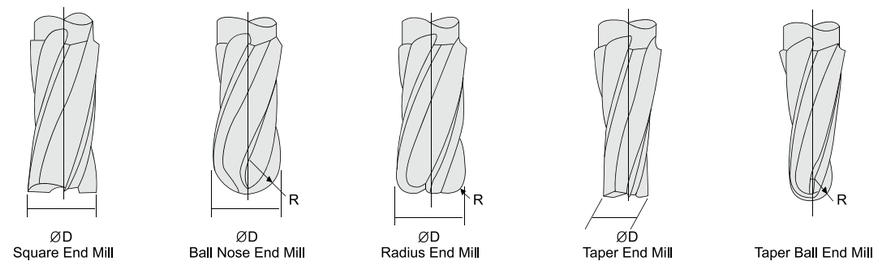
GENERAL INFORMATION

End mill geometry



End mill types



GENERAL INFORMATION

Speed, feed and depth of cut are the most important factors to consider for best results in milling. Improper feeds and speeds often cause low production, poor work quality and unnecessary damage to the cutter.
This section covers the basic principles of speed and feed selection for milling cutters and end mills. It will serve as a guide in setting-up new milling jobs.

Speeds
In milling, SPEED is measured in peripheral metres per minute.(rpm x cutter circumference in metres). This is frequently referred to as “peripheral speed” “cutting speed” or “surface speed”.

Use lower speed ranges for	Use higher speed ranges for
Hard materials Tough materials Abrasive materials Heavy cuts Minimum tool wear Maximum cutter life	Softer materials Better finishes Smaller diameter cutters Light cuts Unstable workpiece set-ups Hand feed operations Maximum production rates Non-metallic materials

Feeds
Feed is usually measured in milimeters per minute. It is the product of feed per tooth times revolution per minute times the number of teeth in the cutter. Due to variations in cutter sizes, numbers of teeth and revolutions per minute, all feed rates should be calculated from feed per tooth. Feed per tooth is the basis of all feed rates per minute, whether the cutters are large or small, fine or coarse tooth, and are run at high or low peripheral speed. Because feed per tooth affects chip thickness. It is a very important factor in cutter life.
Highest possible feed per tooth will usually give longer cutter life between grinds and greater production per grind. Excessive feeds may over load the cutter teeth and cause breakage or chipping of the cutting edges. The following factors should be kept in mind when using the recommended starting feed per tooth.

Use lower feeds for	Use higher feeds for
Light and finishing cuts Unstable set-ups Hard to machine materials Small diameter cutters Deep slots High tensile strength materials Fine tooth cutters	Heavy, roughing cuts Rigid set-ups Easy to machine materials Rugged cutters Low tensile strength materials Coarse tooth cutters Abrasive materials

Basic formulae

v_c - cutting speed (m/min)
n - RPM (rev/min)
f_n - feed rate (mm/rev)
ø - tool diameter (mm)

To calculate RPM from cutting speed: $n = \frac{v_c * 1000}{\pi * ø}$

To calculate cutting speed from RPM: $v_c = \frac{n * \pi * ø}{1000}$

All recommendations are based on ideal machining conditions. Adjustments may need to be made according to your set-up. The recommendations for speeds, feeds and other parameters presented in this chart are nominal recommendations and should be considered only as good starting points.

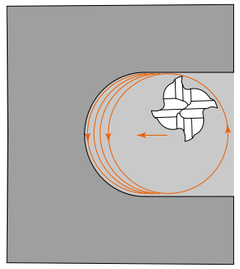
TROUBLESHOOTING

Problem	Instance of problem	Solution options
Tool breaks	At start or end of cut	Reduce overhang Use shorter tool Use lower feed rate
	During cutting	Check tool for wear and replace sooner Check toolholder for wear and replace Reduce overhang Use shorter tool Use lower feed rate Check coolant flow
	Changing direction	Check tool for wear and replace sooner Check toolholder for wear and replace Use lower feed rate when changing direction Use circular interpolation if possible
Cutting edge breaks	Corner chipping	Reduce overhang Use shorter tool Use climb milling
	Break at depth of cut	Use climb milling Use lower cutting speed
	Centre chipping	Use larger tool if possible Use higher cutting speed If noisy during cutting, use higher feed rate Check coolant flow Check toolholder for wear and replace
	Break of cutting edge	Use larger tool if possible Use lower feed rate Use lower cutting speed Check toolholder for wear and replace Check coolant flow
Heavy tool wear		Use lower cutting speed Use conventional milling Use higher feed rate Check coolant flow
Poor surface finish	Good finish but rough	Use lower feed rate Check coolant flow
	Chip welding	Use higher cutting speed Use higher feed rate Use conventional milling Check coolant flow
	Scoring	Use climb milling Check coolant flow
	Excessive cut marks	Use smaller radial depth of cut for finishing Use higher cutting speed Use lower feed rate
Poor accuracy	Undersize	Use conventional milling Use smaller radial depth of cut for finishing Check toolholder for wear and replace Reduce overhang Use higher cutting speed
	Not perpendicular	Use smaller radial depth of cut for finishing Check toolholder for wear and replace Reduce overhang Use higher cutting speed Use lower feed rate Check tool for wear and replace sooner
Chattering		Use higher or lower cutting speed Use higher feed rate Check toolholder for wear and replace Reduce overhang Use climb milling

MILLING TECHNIQUES

Trochoidal milling

Trochoidal milling should be used as the preferred method for producing slots using high speed machining. Multi-flute tools are normally used to allow higher radial feed rates, and high cutting speeds reduce the amount of time taken to produce the slot. Small radial depths of cut are taken, so the cutter removes thin sections of material as it follows continuous spiral paths along it's radial direction. Low cutting forces are generated as the tool engages, allowing large axial depths of cut. Generally, the tools maximum cutting length is used to ensure wear is uniform, which gives longer tool life than standard slotting techniques. Cutters should be no smaller than half the width of the slot. For further information on this technique, please contact us directly.



Waterline milling

Waterline milling is a form of contour milling mainly used when machining thin wall pockets such as those in aerospace rib components. The material is removed in a series of steps or levels, much as if draining water from the pocket. It is only suitable for pockets with steep angled or parallel walls. The material is removed from either side of the wall alternately to give support to the wall. The depth of material removed with each step is normally identical on each side of the wall (fig.1), but for additional support the passes can be made at differing depths (fig.2). This is sometimes referred to as step-supported milling.

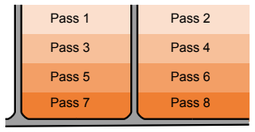


fig.1

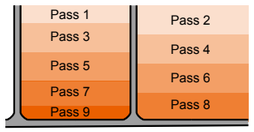

fig.2

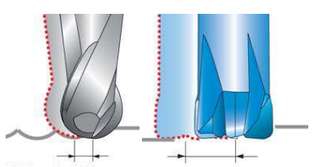
High feed milling

High feed milling is a form of roughing which allows for high metal removal rates using small depths of cut at high speeds. Generally the tools used are straight fluted with corner radii, and produce a thin chip which carries heat away from the component surface. Ideally suited to mould and die applications, our tools will allow radial depths of cut up to ten times higher than conventional ball nosed mould and die tools. They can also be used for high speed finishing, producing a mirror finish. The tools are also much more rigid when machining sloping wall cavities, as the cutting forces are directed axially, so reducing the risk of vibration and increasing stability.

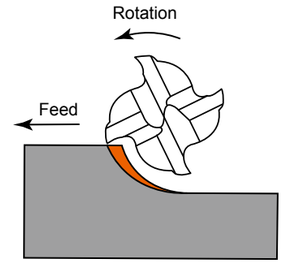


TECHNICAL DATA

MILLING TECHNIQUES

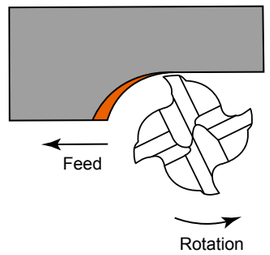
Climb milling (Down & Side milling)

Climb milling should be used as the preferred method for general machining when machine and workpiece stability are suitable. The cutter rotates along the same direction as the feed, causing the chips to be ejected behind the cutter. Using this method, the chip width starts at it's maximum and ends at zero, so heat generated while cutting is generally transferred to the chip. The shear plane is also smoother which causes less friction, increases tool life and gives a better surface finish. In horizontal milling, climb milling creates downward force so workpiece is held more securely to the machine bed.
If the machine or workpiece are not rigid, conventional milling should be used.



Conventional milling (Up milling)

Conventional milling should be used if machine or workpiece rigidity is not good. The cutter rotates against the line of feed, causing chips to be ejected forwards. This can lead to chips being re-cut and surface finish to be poor. Using this method, the chip width starts at zero and finishes at it's maximum width, so heat generated while cutting tends to be transferred to the workpiece. This can cause work hardening, which leads to faster tool wear. In horizontal milling, conventional milling can cause the workpiece to lift, meaning fixturing has to be more extensive to negate this.
If rigidity allows, climb milling should be used.



Although climb milling should always be the preferred choice, there are times when conventional milling gives better results. For example, castings or case hardened parts can be cut more effectively with conventional milling as the cut starts beneath the skin of the material, so providing fixturing is adequate it can lead to improved surface finish and tool life. Tighter tolerances can sometimes also be held when slot milling by using conventional milling, but this will be dependant on set-up rigidity.

MATERIAL CHART

Please note: These charts are not cross-reference charts.
Materials are grouped according to machinability and are not necessarily identical in chemical composition.

	2.4856	Inconel 625			Monel K-500	
	2.6554 LN	Waspaloy				
60 COPPER **N**	**61. Copper, unalloyed - Hardness < 100 HB 30 - Tensile strength < 350 N/mm²**					
	2.0060	E - Cu 57				
	2.0070	SE - Cu			Commerially Pure	
	2.0090	SF - Cu		C 101		
	2.1356	Cu Mn 3				
	2.1522	Cu Si 2 Mn				
	62. Short chip copper alloys - Hardness < 200 HB 30 - Tensile strength < 700 N/mm²					
	62.1 - Brass					
	2.0360	Cu Zn 40(MS 60)				
	2.0380	Cu Zn 39 Pb 2 (MS 58)		CZ120, CZ109		
	2.0410	Cu Zn 44 Pb 2		PB104		
	2.0561	Cu Zn 40 Al 1			2.1030, 2.1080	
	2.0580	Cu Zn 40 Mn 1 Pb				
	2.0771	Cu Ni 7 Zn 39 Mn 5 Pb3				
	62.2 - Bronzes					
	2.1086	G-Cu Sn 10 Zn				
	2.1093	G-Cu Sn 6 Zn Ni				
	2.1096	G-Cu Sn 5 Zn Pb				
	63. Long chip copper alloys - Hardness < 200 HB 30 - Tensile strength < 700 N/mm²					
	63.1 - Brass					
	2.0250	Cu Zn 20				
	2.0265	Cu Zn 30				
	2.0321	Cu Zn 37		CZ108, CZ106		
	2.0335	Cu Zn 36 (Ms 63)				

MATERIAL CHART

Please note: These charts are not cross-reference charts.
Materials are grouped according to machinability and are not necessarily identical in chemical composition.

ISO GROUP	STANDARDS					
	GERMANY		FRANCE AFNOR	GREAT BRITAIN B.S.	EN & OTHER CLASSIFICATIONS	U.S.A. AISI
	W.Nr	DIN				
60 COPPER **N**	63.2 - Bronzes					
	2.1020	Cu Sn 6				
	2.1030	Cu Sn 8				
	2.1080	Cu Sn 6 Zn 6				
	63.3 - Copper alloys tempered by forging
