DELUXE MODEL

How Does It Work?

Salt is added to the pool water. After the salt is completely dissolved, your pool or spa water should read approx 0.6% salt content. (Sea water is 3.5%). The slightly salinated water then passes through the electrolytic cell and this produces chlorine gas, which prevents algae and purifies the pool or spa.

Salt is only lost by rain overflow, splash out or filter backwashing. Experience has shown that about 6 bags (150 kgs) of salt per year is required to maintain adequate salt level, for an average size pool. Providing pool chemistry is maintained at the correct levels, no powder or liquid chlorine should be added.

Model	Pool Size (Litres)
A75	10,000
A150	60,000
A200	80,000
A300	150,000
A500	250,000
