DENTANOMIC MODULAR DENTAL INSTRUMENTS were created for safer, faster and easier dental surgery. The innovative modular design allows easy replacement of blades or other parts of the instruments without having to replace an entire damaged instrument as with other systems. Dentanomic blades are made from top quality hardened tempered stainless steel, which increases blade effectiveness and makes surgery easier. The blades support two common surgical techniques, elevation and luxation. The instruments also promote a safer 'palm grip' technique which helps prevent dangerous slips while reducing hand fatigue and repetitive injury to the dental surgeon. The instrument handles are ergonomically designed with flat surfaces to make the handle easy to grip. The instrument fits in the palm of the hand with blades that are easily interchangeable and replaceable. Both handle options will accommodate all blade sizes and are designed to fit small or large hands.

TWO TECHNIQUES, ONE TOOL

ELEVATION

Useful for shorter, robust roots.
Stretches periodontal ligament.

Video:

1. Wedge the blade into the periodontal space.
2. Gently apply a single twist until resistance is felt. Then HOLD steady pressure.
3. Stretch ligament for 15-30 seconds. Repeat around circumference of tooth.

LUXATION

Useful for thinner, weaker roots.
Cuts periodontal ligament.

Video:

1. Insert blade into the periodontal space.
2. Rock blade sideways into periodontal space. Do NOT lever the blade out or away from the tooth; stay within the periodontal space.
3. Simultaneously contour the blade around the root.
