Installation Guide

MST7005

Mercedes A35 AMG 2.0L

This product has been designed and manufactured to work correctly with installation as described in these instructions.

Failure to follow these instructions could result in damage to property, damage to the product and or potential injury.

It is very important that you read and understand these instructions thoroughly before installing this product.

Mercedes 1.5/2.0 - 3 Channel Petrol

Included Contents

- Tuning Module
- Wiring Loom
- Fastening Ties
- Installation and User instructions
- Protective Bag For Module - (prevents damage to unit casing)

Before Installation

1. Open the vehicle's bonnet
2. Remove the ignition key
3. Close and lock the doors
4. Wait 5 minutes before removing any electrical plugs

Installation Location

The module should be installed between the vehicle's Rail and Boost Pressure sensors as shown in the diagram.

Locating the Unit

The unit itself should be mounted away from

Sources of Extreme Heat

Sources of Vibration

Sources of Spray Water

Do not open the vehicle doors or unlock the vehicle while installation is in progress

H3-H3-H3-SENT-805

- Ensure that your engine looks similar to the supplied photographs (minor changes with ancillary components are to be expected, however if the engine looks nothing alike, please contact support).

- Remove the plastic engine cover. This usually pulls off with a firm tug. On certain models the cover is secured with bolts. If this is the case, remove the bolts and lift off the engine cover.
- Familiarise yourself with the locations of the connectors highlighted.
- Make sure that you have a good grasp of the operation of the connector clips. If the connectors you are trying to access are in an awkward place, it may be useful to try unplugging (and then re-inserting) a connector on the vehicle which is more easily accessible. Alternatively try plugging together the connectors on the Tuning Module itself.

STEP 1

- Unplug the MAP Sensor connector (3 pin) by sliding back the grey release clip then pressing down the releasing clip and pulling back the connector.
- Insert the connector from the Tuning Module's wiring loom into the MAP Sensor.
- Insert the Vehicle's MAP Sensor connector into the corresponding connector on the Tuning Module's wiring loom.
- Secure the MAP wiring loom.

STEP 2

- Unplug the Boost Sensor connector (3 pin) by sliding back the grey release clip then pressing down the releasing clip and pulling back the connector.
- Insert the connector from the Tuning Module's wiring loom into the MAP Sensor.
- Insert the Vehicle's Boost Sensor connector into the corresponding connector on the Tuning Module's wiring loom.
- Secure the Boost wiring loom.

MASATA

STEP 3

- Unplug the CAM Sensor connector (3 pin) by sliding back the grey release clip then pressing down the releasing clip and pulling back the connector.
- Insert the connector from the Tuning Module's wiring loom into the CAM Sensor.
- Insert the Vehicle's CAM Sensor connector into the corresponding connector on the Tuning Module's wiring loom.
- Secure the CAM wiring loom.

Mercedes 1.5/2.0 - 3 Channel Petrol

Route the tuning box wiring harness away from sources of heat (exhaust manifolds, EGR pipes, most stainless steel pipes) and also away from any rotating parts such as belts.

- Double check all connections are correct and firmly connected. If this is the case, start the vehicle and ensure there are no engine warning lights or error messages displayed.

If everything is as it should be, please feel free to take the vehicle out for a test drive and enjoy the added responsiveness and power added to your vehicle by the Tuning Module.
