Instruction to apply thermal transfer printing to a garment

• Preheat the iron to the recommended temperature for the heat transfer vinyl.
（Normal-130C-140C or 266F-284F）

• Place the T-shirt on a flat surface and position the heat transfer vinyl on the desired location.

• Cover the heat transfer vinyl with a thin cloth or Teflon sheet to protect it from direct heat.

• Apply firm pressure with the iron for 10-15 seconds, moving it around to ensure even heat distribution.

• Let the vinyl cool for a few seconds before peeling off the transfer sheet.

• If necessary, repeat the process with the cloth or Teflon sheet until the vinyl is fully adhered to the T-shirt.

• Allow the T-shirt to cool completely before wearing or washing.

Please use the electric iron with caution and pay attention to safety.
