

# Glider Uno

## 4th Axis Stabilizer

### Quick-Start Guide

*This quick-start guide is designed to get you up and running ASAP. To fully master the Glider Uno stabilizer it's highly recommended to go through the User Guide.*

#### Setup

- 1) Attach your mount (clamp or base mount) to your gimbal

- 2) Slide mounted gimbal onto Glider and lock down the quick-lock lever so that it sits close to horizontal.

- 3) Turn the damping knob to zero.

- 4) Turn the payload adjuster knob until the gimbal lifts up enough so that it won't bottom out during your test shot. The arms don't need to be horizontal, just as long as they

don't hit the bottom or top of the suspension arms travel during your test footage.

- 5) Try to use soft hands when filming.
- 6) Shoot a short 10 - 20 second moving shot to test out the smoothing. At 0% damping you will likely get some uncontrolled bouncing when speeding up or slowing down.
- 7) Adjust the damping to about 10% damping and try again. Keep testing and increasing the damping each time. Eventually you will find that the damping becomes too strong and small hand movements will be transferred to the footage.
- 8) Back off the damping slightly and look very closely at the footage to see if the micro movements from your hand movements are still visible.
- 9) When there's no hand movements keep a note of the percentage damping and the type of filming movement (i.e walkin, jogging etc) for future reference.
- 10) Re-test at different intensities to get the best settings for your own filming movements. As you master the Glider you'll also find these settings will change too.
