Model 98 Mulch Lifter

The Model 98 Mulch Lifter provides an easy and efficient way to lift plastic mulch. It is designed with two coulters to cut the edges just outside of the plastic and one coulter to cut the center of the plastic. The center coulter also cuts the vines and plant debris as the undercutting knives loosen the plastic. The two strips can then be easily pulled away, leaving the plant debris in the field.

Features of the Model 98

- Completely adjustable unit for various width plastics
- Three adjustable spring loaded swivel coulters
- Two heavy duty hardened undercutting knives
- Gauge wheels to hold the correct undercutting knife depth
- Toolbar clamp design for quick and easy changes
- Heavy duty three point hitch
