Biological exposure indices (BEI) are values used for guidance

to assess biological monitoring results. With respect to

chemical exposure, biological monitoring is the measurement of the concentration of a chemical marker in a human biological media that indicates exposure. They are not developed for use as legal standards.

TCL Toxic Concentration Low

Toxic Dose Low: lowest dosage per unit of bodyweight (typically stated in

milligrams per kilogram) of a substance known to have produced signs of

toxicity in a particular animal species.

Threshold Limit Value (ACGIH):The time weighted average used to

describe exposure which is harmless to most of the population when

exposed 8 hours per day, 40 hours per week.

TWA (Time Weighted Average): The average airborne concentration of a

particular substance when calculated over a normal eight-hour working

day, for a five-day week.

These exposure standards are guides to be used in the control of occupational health hazards. All atmospheric contamination should be kept to as low a level as is workable. These exposure standards should not be used as fine dividing lines between safe and dangerous concentrations

of chemicals. They are not a measure of relative toxicity.

occupational health and safety and workers' compensation arrangements

across Australia.
