

UPGRADE YOUR TICK CONTROL PROGRAM

Ticks on untreated mouse

Strengthen Protection

Kills immature ticks on mice where sprays don't reach.

Increase Revenue

Complements spray programs.

Easy Application

Apply in minutes.
No equipment needed.

See What Pros Are Saying

“Living in a top state for Lyme disease, we pride ourselves on offering the most reliable tick protection. Thermacell Tick Control Tubes are an important part of our tick toolkit, helping us achieve excellent results for our customers. ”

- Kara Maggiacomo

Mosquito Squad, North Central Rhode Island

THERMACELL
TICK CONTROL TUBES

Box contains 96 tubes.

24 tubes per acre per application.

KILL TICKS

Where Sprays Can't Reach

THERMACELL
TICK CONTROL TUBES

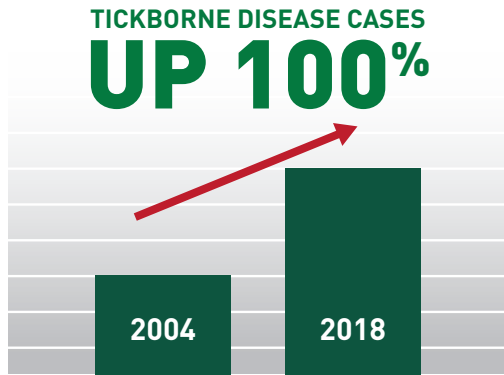

KILL TICKS WITH LYME WHERE SPRAYS CAN'T REACH

Thermacell Tick Control Tubes deliver a targeted tick killer without harming kids, pets or the environment.

Thermacell Tubes contain a permethrin treated cotton that kills immature deer ticks when they feed on mice, their primary host.

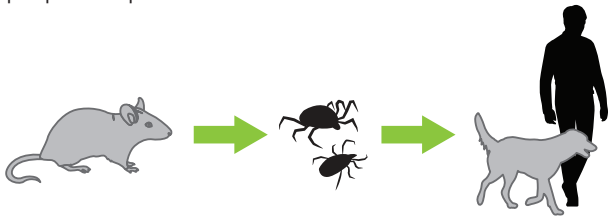

Ticks and Lyme Disease - A Growing Problem

US tickborne diseases increased more than 100% from 2004 to 2018.¹ Lyme disease accounted for over 80% of these cases.² With over 300,000 Americans infected a year, Lyme is the #1 tickborne disease in America.

Mice and Ticks are the Problem

Mice are the primary source of Lyme disease infected ticks on a property. And these infected ticks pass Lyme on to people and pets.

Sprays Don't Reach Mice...

Mice are nocturnal, foraging for food by night. When a yard is sprayed, mice are asleep in their nests underground, inside sheds or other places sprays don't reach.

... So Sprayed Yards Still have Ticks with Diseases

Field tests by the University of Rhode Island show ticks remain on mice in yards sprayed with bifenthrin or cedar oil. As a result there is a persistent risk of people and pets contracting Lyme and other diseases.

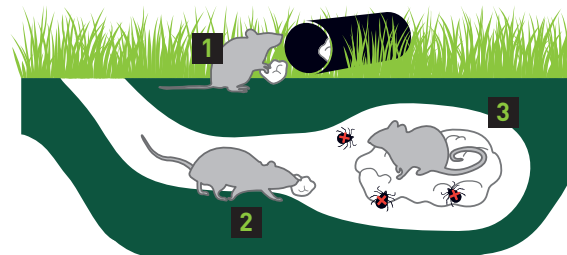

TICKS PER MOUSE IN SPRAYED YARDS		
	Average	Maximum
CEDAR OIL	5.6	87
BIFENTHRIN	2.6	41

TICKS IN THE YARD = DISEASES IN THE YARD

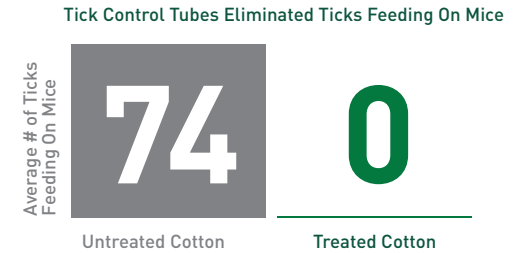

Tick Control Tubes are the Solution

1. Thermacell Tick Control Tubes contain cotton treated with permethrin insecticide.
2. Mice collect the treated cotton and use it to line their nests, rubbing the insecticide into their fur.
3. Ticks feeding on the mice die.

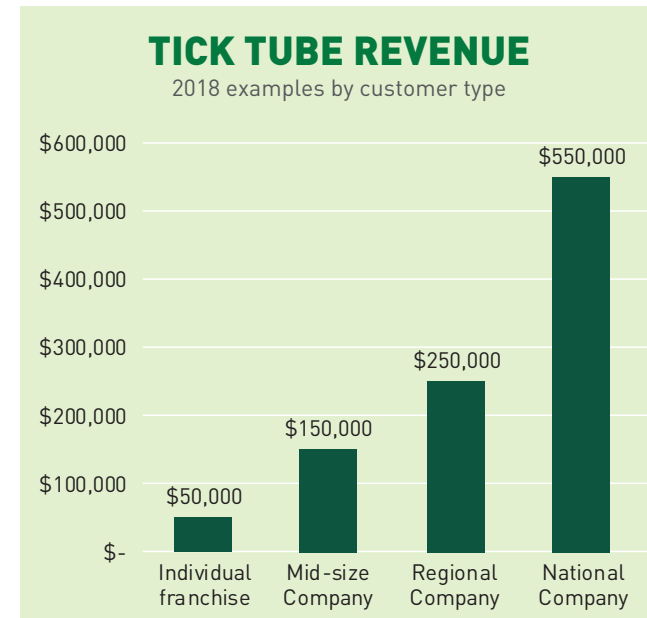

Ticks Don't Feed on Treated Mice and Die

In lab tests conducted by Dr. Thomas Mather at the University of Rhode Island TickEncounter Resource Center, mice were exposed to untreated and permethrin-treated cotton. The mice were then exposed to 119 immature blacklegged ticks. On average 74 ticks fed on the untreated mice, but no ticks fed on the permethrin-treated mice, and virtually all the ticks exposed to the treated mice died in under two hours.

Tick Tubes Add Significant Incremental Revenue
