

CHEST SUPPORTED ROW MACHINE

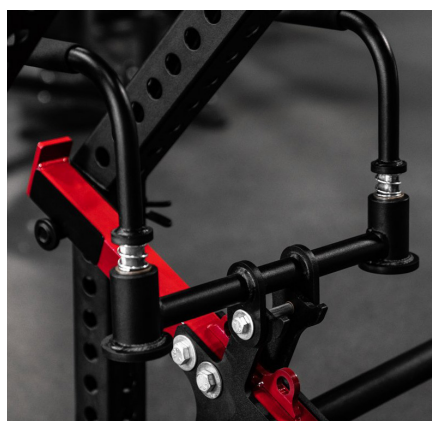

The Sorinex Chest Supported Row is a leverage machine that is designed to utilize the many strengths of a traditional chest supported row with the added versatility of the Sorinex system. The main arm of the Sorinex Chest Supported Row is designed to be plate loaded with a universal joint attachment that allows the arm to move laterally as well as vertically. The arm is equipped with rotating adjustable spring-loaded handles to allow vertical grip as well as horizontal grip and all grips in between. The 4-way hole technology allows you to attach band pins or utility pins to add banded resistance or assistance. As far as chest supported row machines are concerned this is the best on the market.
