

1. Remove your door panel, remove your speaker, and unplug all of the connecting cables.

2. Wipe down the metal surfaces around and behind the speaker hole. Be sure it is clean of all debris, oil, dust, moisture, etc. and let it air dry completely. Take the acoustic wavy foam pieces and apply them onto the metal surface behind the speaker (inside the speaker hole).

3. Then, reinstall the speaker and wipe down the trim of the speaker plate. Peel off the backing on part of a foam strip and apply the strip around the face of the speaker, peeling off the backing as you go until the entire speaker face is covered.

4. Trim off the excess material with scissors and connect the two ends of the strips. Your installation is complete, and you can reinstall your door panel.
