March 15, 2010

Dear Mr. Vollmer,

Please find the results of our SVA pellet test below.

Organic matter reduction program

Method: grab samples of the substrate within the Lauderdale Lakes, Baywood Association beach area were taken before, during and after the test period. Composite sediment samples from 4 to 24" of water were used for this test. Samples were sent to a state certified laboratory, where they were dried at 105C to remove water and weighed, followed by ignition in a muffle furnace at 550C for 2 hours. The remaining weight is mineral content (sand, metals, clay, etc.).

Total Product Used – 24#'s
4# per week for the first 4 weeks
2# every other week thereafter
Beach area sampled 15' x 40'

April 28, 2009 sample	1.51% of the sample was organic in nature
July 17, 2009 sample	1.4% of the sample was organic in nature
August 27, 2009 sample	0.9% of the sample was organic in nature

Results: The SCVA pellets used in the beach area appear to have reduced overall organic content significantly. Prior to the addition of the product, organic matter composition was 1.68 times greater than the composite at the end of the testing period.

Thank you for your participation in this test.

Sincerely,

Roy Carlson
