I'm loving this whole line so much. It's changed our homeschool for the better!

—Amy ★★★★

Your reputation as a publisher is stellar. It is a blessing knowing anything I purchase from you is going to be worth every penny!

—Cheri ★ ★ ★ ★ ★

Last year we found Master Books and it has made a HUGE difference.

-Melanie ★★★★

We love Master Books and the way it's set up for easy planning!

—Melissa ★★★★★

You have done a great job. MASTER BOOKS ROCKS!

—Stephanie ★★★★★

Physically high-quality, Biblically faithful, and well-written.

—Danika ★★★★

Best books ever. Their illustrations are captivating and content amazing!

—Kathy ★★★★

#### **Author Bio:**

**Tom DeRosa** is an experienced science educator, a committed creationist, and founder/director of a growing national creation organization whose chief focus is education. His experience in the public school, Christian school, and homeschool markets for over 35 years has given him special insights into what really works in engaging young minds. He holds a master's degree in education, with the emphasis of science curriculum.

**Carolyn Reeves** is especially skilled at creating ways to help students develop a greater understanding of not just scientific concepts, but also how these are applied within the world around us. Carolyn retired after a 30-year career as a science teacher, finished a doctoral degree in science education, and now serves as a writer and an educational consultant.

# **Using This Teacher Guide**

**Features:** The suggested weekly schedule enclosed has easy-to-manage lessons that guide the reading, worksheets, and all assessments. The pages of this guide are perforated and three-hole punched so materials are easy to tear out, hand out, grade, and store. Teachers are encouraged to adjust the schedule and materials needed in order to best work within their unique educational program.

**Lesson Scheduling:** Students are instructed to read the pages in their book and then complete the corresponding section provided by the teacher. Assessments that may include worksheets, activities, quizzes, and tests are given at regular intervals with space to record each grade. Space is provided on the weekly schedule for assignment dates, and flexibility in scheduling is encouraged. Teachers may adapt the scheduled days per each unique student situation. As the student completes each assignment, this can be marked with an "X" in the box.

	Approximately 30 to 45 minutes per lesson, two to three days a week
	Includes answer keys for quizzes and semester tests
	Multi-level quizzes and tests are included to help reinforce learning and provide assessment opportunities
*	Designed for grades 3 to 6 in a one-year course. Master supply list included.
	Supports activity-based learning

# **Course Objectives:** Students completing this course will:

- ✓ Investigate the physical properties of chemical substances
- → Become familiar with the difference between chemical changes and physical changes
- ✓ Identify the scientist who organized a chart of the known elements
- ✓ Learn why adding heat causes most chemical changes to react faster

- ✓ Study what happens to light waves when we see different colors
- → Discover how to see an invisible magnetic field
- ✓ Learn about how solar energy can be changed into electrical energy
- ✓ Determine the essential parts of an electric circuit

## **Course Description**

Based on the *Investigate the Possibilities* Series, this course comes alive through experiments that demonstrate scientific principles, while affirming a biblical worldview. It has been developed so multi-age students can learn together. This one-year curriculum provides an activity using household items then gives easy-to-understand explanations and descriptions of the scientific process at work. How big is the solar system? How big is the universe? Can we make a model to help us understand God's wonderful creation? These and other questions are answered through a fun and investigative process created for upper elementary students!

## **Multi-level Quiz & Test Options**

The Science Starters curriculum allows multi-age students between grades 3 and 6 to be taught at the same time. For your convenience, we have included two different levels of quizzes and semester tests so that you can choose the ones most appropriate for your student's age and educational abilities. Suggested levels include:

Level 1 – Grades 3 to 4 Level 2 – Grades 5 and 6

# **Calculating a Final Grade**

Add up the numbers for the Final Grade:
Divide the average by 3
Calculate the Average of the student's Projects, Contest & Dig Deeper grades.
Divide the average by 3
Calculate the Average of the student's Questions & Quizzes grades.
Divide the average by 3
Calculate the Average of the student's Activities & Observations grades.

#### **Quizzes and Test**

#### for Use with

### Matter

#### **Testing:**

This series is appropriate for elementary students from 3rd to 6th grades. Because of this, we have included quizzes and tests in two different levels, which you can choose from based on your child's abilities and understanding of the concepts in the course.

Level 1: suggested for younger ages or those who struggle with application of the concepts beyond just definitions and basic concepts

Level 2: suggested for older ages or those who can both grasp the scientific concepts and apply them consistently

infrared kinetic liquids medical polymers pressure smaller solids surface temperature viscosity  Fill in the Blank: Each question is worth 4 points.  1 chemistry includes what chemicals are present, their characteristics, and how much is present.  2 labs might test blood and urine for the presence of many kinds of substances.  3. An agency may use a lab that analyzes chemical substances to help identify pollutants in the air and water and environment.  4. A would have the same properties as the whole substance.  5. The properties of a piece of pure iron are the same anywhere pure iron is found.  6 can be explained by how slowly a liquid pours from a container or how hard it is to push something through the liquid.  7. Viscosity of oils and molasses is often affected by  8 (and temperature) affects the viscosity of MX.	abs	orb	analytical	chemicals	chromatography

water			

# Fill in the Blank: Each question is worth 4 points.

T.II	in the blank: Each question is worth 4 points.
1.	Some of the most important properties of water occur because water molecules are slightly positive at one end and slightly negative at the other end. These kinds of molecules are called molecules.
2.	Oil molecules are
3.	Generally,substances will not dissolve in polar substances.
4.	molecules have a polar end that can dissolve polar substances and a non-polar end that can dissolve non-polar substances.
5.	It isto wash oil off your hands using only water because water, a polar compound, cannot dissolve oil, a non-polar compound.
6.	Citrus fruits contain
7.	Many common cleaners contain
8.	Acids and bases are usually found in solutions .
9.	Acids usually have a taste.
10.	Chemicals that change color in acids and bases are called
11.	acid forms when there is a chemical reaction between carbon dioxide and water.
12.	Water and a form when an acid and a base react chemically.
13.	Ordinary rain water is slightly
14.	A pH number of 7 tells you it is
15.	A pH of 2 indicates a strong
16.	The Periodic Table contains
17.	Metals are found to the of the dividing line on the Periodic Table.

18. A chemical on the Periodic Table.	is one or two letters that have been assigned to identify an element
19. A chemical and numbers to tell how many of ea	contains symbols to tell which elements are present in a compound ach kind of atom are present.
20. Sodium chloride crystals have a	shape.
Short Answer: Each question is worth	5 points.
21. Why is it hard to get oily substances	s, such as lipstick, out of clothing using only water?
22. What happens to acids and bases wl	hen they are in water solutions?
23. Give some examples of indicators.	
24. What kinds of elements are generall	ly found in salt?
<b>Bonus Question</b> (worth 5 points):  25. If you accidentally spilled a strong a	acid or base on your skin, what is the first thing you should do?

# Quiz and Test Answers for Use with

Science Starters: Elementary Chemistry and Physics

# Matter → Quiz Answer Keys Level 1 & 2

#### Quiz 1 Level 1, chapters 1-4

- 1. analytical
- 2. medical
- 3. environmental
- 4. fragment
- 5. physical
- 6. viscosity
- 7. temperature
- 8. pressure
- 9. absorb
- 10. polymers
- 11. solids
- 12. liquids
- 13. surface
- 14. cohesion
- 15. elasticity
- 16. mixtures
- 17. faster
- 18. chemicals
- 19. chromatography
- 20. minerals
- 21. Physical properties include characteristics you can see, hear, taste, smell, or feel, but could be any physical characteristic of a substance.
- 22. It is a dull white color. It can flow like a liquid when poured from a container. When pressure is applied quickly, it will have properties like a solid. Its viscosity varies with pressure.
- 23. A substance's physical properties will be present regardless of the size, shape, or amount of the substance. Scientists look for characteristics that will remain the same no matter where the chemical is found.
- 24. Yes, this is a good clue that there are at least two chemicals in the marker.
- 25. Density, boiling point, melting point, solubility in water, color, odor, taste, shininess, hardness, magnetic effects, and many other things.

#### Quiz 2 Level 1, chapters 5-8

- 1. mixed
- 2. chemically
- 3. distillation
- 4. separated

- 5. evaporating
- 6. milliliter
- 7. centimeter
- 8. milligram
- 9. water
- 10. sink
- 11. tetrahedron
- 12. polar
- 13. liquid
- 14. water
- 15. smallest
- 16. polar
- 17. surface
- 18. adhesion
- 19. density
- 20. negative
- 21. Salt and sand stirred together, crude oil, and salt water are all mixtures. (Distilled water is a pure substance.)
- 22. Measure enough water in a graduated cylinder to cover the rock. Carefully add the rock, and measure the level of water. Subtract the two water levels to find the volume of the rock.
- 23. Positive and negative.
- 24. The water will round up on the penny. There are strong cohesive forces between the water molecules, especially at the surface of the water.
- 25. A person's mass would remain the same. What happens to the person's weight? A person's weight would decrease as the distance from the earth increased.

### Quiz 3 Level 1, chapters 9-12

- 1. polar
- 2. non-polar
- 3. non-polar
- 4. soap
- 5. hard
- 6. acids
- 7. bases
- 8. water
- 9. sour
- 10. indicators
- 11. carbonic
- 12. salt
- 13. acidic
- 14. neutral

- 15. acid
- 16. elements
- 17. left
- 18. symbol
- 19. formula
- 20. boxy
- 21. Lipstick and other oily substances are non-polar compounds, and water is a polar compound. Polar compounds do not dissolve non-polar compounds.
- 22. Their molecules break apart. One part becomes positive and one part becomes negative.
- 23. Phenol red, litmus paper, pH paper (many others).
- 24. A metal and a nonmetal (or groups of atoms that behave as if they were a single metal or nonmetal. Examples of such groups of atoms are carbonates, CO3- or phosphates, PO4-).
- 25. You should dilute the chemical by pouring lots of water on your skin.

#### Quiz 4 Level 1, chapters 13-16

- 1. vertically
- 2. metals
- 3. less
- 4. blanks
- 5. gas
- 6. electrolysis
- 7. oxygen
- 8. hydrogen
- 9. water
- 10. hydrogen
- 11. properties
- 12. carbon
- 13. steam
- 14. chemical
- 15. physical
- 16. chemical
- 17. chemical
- 18. physical
- 19. chemical
- 20. chemical
- 21. Most reactive: potassium, chlorine, and selenium.
- 22. Tearing paper, grinding up chalk, boiling water, freezing water, melting ice, drying wet clothes, and dissolving sugar in a glass of tea are a few examples of physical changes.
- 23. Burning paper, combining vinegar and baking soda, rusting of iron, removing iron from iron ore, and

- combining sulfuric acid and zinc are a few examples of chemical changes. There are many other examples.
- 24. Formation of bubbles, temperature change, formation of an insoluble chemical, and color change.
- 25. This would have been strong evidence against the theory that water was one of the four basic elements.

#### Quiz 5 Level 1, chapters 17-20

- 1. carbon dioxide
- 2. oxygen
- 3. dry ice
- 4. burn
- 5. carbon dioxide
- 6. molecules
- 7. heat
- 8. temperatures
- 9. controls
- 10. procedure
- 11. gas
- 12. solid
- 13. physical
- 14. cold
- 15. water
- 16. air
- 17. gas
- 18. evaporation
- 19. cooling
- 20. surface
- 21. Carbon dioxide is a heavy gas that doesn't burn. It will settle over the burning candle and cut off the oxygen supply.
- 22. Small pieces of an effervescent tablet have more surface area than one big piece and more places where the water molecules can come in contact with them.
- 23. When the cement gets hotter, its molecules begin to move faster and get farther apart. This causes the cement to expand. The cracks help to keep it from breaking as it expands.
- 24. In order for a liquid to change into a gas, it must absorb energy. As sweat drops evaporate, energy is absorbed from your skin.
- 25. A peer review is where fellow scientists review an experiment someone has conducted. They may comment about the things that were done right, but they especially look for things that should have been done differently or might be a weakness in the experiment. They are often called critical peer

reviews. They are an important part of scientific research.

#### Quiz 1 Level 2, chapters 1-4

- 1. Physical properties include characteristics you can see, hear, taste, smell, or feel, but could be any physical characteristic of a substance.
- A substance's physical properties will be present regardless of the size, shape, or amount of the substance. Scientists look for characteristics that will remain the same no matter where the chemical is found.
- Density, boiling point, melting point, solubility in water, color, odor, taste, shininess, hardness, magnetic effects, and many other things.
- 4. An element or a compound; a fragment would have the same properties as the whole substance.
- 5. Analytical chemistry includes what chemicals are present, their characteristics, and how much is present.
- 6. Medical labs might test blood and urine for the presence of many kinds of substances.
- 7. These labs might help identify pollutants in the air, water, and environment.
- 8. How slowly a liquid pours from a container or how hard it is to push something through the liquid.
- 9. Pressure (and temperature)
- 10. It has the unusual property of being able to absorb enormous amounts of liquids.
- 11. They are made of many similar small chemicals (called monomers) that were joined together to form long chains of molecules.
- 12. In solids
- 13. In liquids
- 14. Surface tension
- 15. Cohesion
- 16. Elasticity
- 17. Hard water contains more dissolved minerals than soft water. Hard water is more difficult to lather than soft water.
- 18. Surface tension
- 19. Mixture
- 20. A device used to help analyze the chemicals in substances.

#### Quiz 2 Level 2, chapters 5-8

1. Salt and sand stirred together, crude oil, and salt water are all mixtures. (Distilled water is a pure substance.)

- 2. Every piece of a pure substance has the same properties as the whole substance. A mixture is made of two or more substances that can be separated on the basis of some physical property.
- 3. Yes, except that they may be temporarily hidden from view.
- 4. No
- 5. Their boiling points
- 6. One that is not dissolved in the liquid
- 7. By evaporating the water
- 8. A person's mass would remain the same.
- 9. A person's weight would decrease as the distance from the earth increased.
- 10. Milliliter, liter, cubic centimeter (other units)
- 11. 25 grams
- 12. Positive and negative
- 13. Acids, bases, salts, sugars (many other things)
- 14. Hydrogen and oxygen
- 15. A tetrahedron
- 16. Polar molecules
- 17. Water is a liquid at room temperature; it expands when it freezes; drops of water are rounded in shape; it can dissolve many substances. There are many other properties as well.
- 18. The positive and negative charges attract each other.
- 19. Surface tension
- 20. The density of the substance
- 21. The formula for water is H<sub>2</sub>O. H is the symbol for hydrogen and O is the symbol for oxygen. The subscript 2 means there are 2 atoms of hydrogen in each molecule of water. No number after oxygen means there is one atom of oxygen in each molecule of water.
- 22. An atom is the smallest particle of an element that is still that element. A molecule is made up of two or more atoms joined together by a chemical bond.

#### Quiz 3 Level 2, chapters 9-12

- 1. Polar molecules
- 2. Lipstick is a non-polar compound.
- 3. Water, a polar compound, cannot dissolve oil, a non-polar compound.
- 4. Citrus fruits contain acids.
- 5. Many common cleaners contain bases.
- 6. Acids and bases are found in water solutions.
- Their molecules break apart. One part become positive and one part becomes negative.

## Matter → Test Answer Key Level 1 & 2

#### Test 1 Level 1

- 1. analytical
- 2. viscosity
- 3. cohesion
- 4. elasticity
- 5. minerals
- 6. distillation
- 7. evaporating
- 8. polar
- 9. surface
- 10. adhesion
- 11. soap
- 12. bases
- 13. water
- 14. sour
- 15. indicators
- 16. metals
- 17. electrolysis
- 18. carbon
- 19. physical
- 20. chemical
- 21. oxygen
- 22. carbon dioxide
- 23. heat
- 24. controls
- 25. cooling
- 26. Physical properties include characteristics you can see, hear, taste, smell, or feel, but could be any physical characteristic of a substance.
- 27. A substance's physical properties will be present regardless of the size, shape, or amount of the substance. Scientists look for characteristics that will remain the same no matter where the chemical is found.
- 28. Measure enough water in a graduated cylinder to cover the rock. Carefully add the rock, and measure the level of water. Subtract the two water levels to find the volume of the rock
- 29. Positive and negative
- 30. Their molecules break apart. One part becomes positive and one part becomes negative.
- 31. Phenol red, litmus paper, pH paper (many others).
- 32. Burning paper, combining vinegar and baking soda, rusting of iron, removing iron from iron ore, and

- combining sulfuric acid and zinc are a few examples of chemical changes. There are many other examples.
- 33. When the cement gets hotter, its molecules begin to move faster and get farther apart. This causes the cement to expand. The cracks help to keep it from breaking as it expands.
- 34. A person's mass would remain the same. What happens to the person's weight? A person's weight would decrease as the distance from the earth increased
- 35. You should dilute the chemical by pouring lots of water on your skin.

#### Test 1 Level 2

- 1. Physical properties include characteristics you can see, hear, taste, smell, or feel, but could be any physical characteristic of a substance.
- A substance's physical properties will be present regardless of the size, shape, or amount of the substance. Scientists look for characteristics that will remain the same no matter where the chemical is found.
- 3. Density, boiling point, melting point, solubility in water, color, odor, taste, shininess, hardness, magnetic effects, and many other things
- 4. An element or a compound; a fragment would have the same properties as the whole substance
- Analytical chemistry includes what chemicals are present, their characteristics, and how much is present.
- 6. Elasticity
- 7. Hard water contains more dissolved minerals than soft water. Hard water is more difficult to lather than soft water.
- 8. Surface tension
- 9. Mixtures
- 10. A device used to help analyze the chemicals in substances
- 11. Salt and sand stirred together, crude oil, and salt water are all mixtures. (Distilled water is a pure substance.)
- 12. Every piece of a pure substance has the same properties as the whole substance. A mixture is made of two or more substances that can be separated on the basis of some physical property.
- 13. Yes, except that they may be temporarily hidden from view.
- 14. No
- 15. Their boiling points
