

ANTECH

BETTER DIAGNOSTICS. BETTER MEDICINE.™

A revolutionary way to help veterinarians determine the likelihood of certain canine cancers

Antech is proud to announce that Nu.Q® will soon be available as an in-house diagnostic on Element i+®

Nu.Q® on the Element i+® analyzer will require precisely 50µL of EDTA (purple top tube) plasma for analysis. To run this test, you will need a different size pipette than what is used for other Element i+ tests (100µL blue pipette).

Included in this bag is the Nu.Q® test-specific yellow 50µL pipette used for aspirating and dispensing EDTA plasma samples.

Please remember to use this yellow pipette for any samples intended for Nu.Q® testing, while continuing to use the blue 100 µL pipette for all other tests run on your Element i+®.

Nu.Q® is a registered trademark of VolitionRx Limited and its subsidiaries. The Nu.Q® Canine Cancer Test is supplied to Antech's Heska affiliate under license by Belgian Volition SRL. 49029-001 030724
