NORTHERN BREWER

NIGHTFALL BLACK SAISON

ALL-GRAIN

What happens when a delicious, mild-mannered saison takes a turn toward the dark? A surprising, seductive sort of black magic we are proud to call Nightfall Black Saison! This harmonious hybrid pours black as pitch but still sips with the complex, lightly spicy notes of a classic farmhouse ale...Just one that's been brewed after lights-out to capture a rich and darkly delicious malt character, with barely a hint of roast. Unexpected? Yes. Unforgettable? Hell yes. Nightfall balances the best of sun-dappled days and moonless nights in one tall, dark and deceptively drinkable brew. So get ready to drink in the dark. Nightfall has cometh.

O.G: 1.060 BREW TIME 6 WEEKS: 2 WEEKS PRIMARY | 1 -2 WEEKS SECONDARY | 1 -2 WEEKS BOTTLE CONDITIONING

READ ALL INSTRUCTIONS BEFORE STARTING

YOU WILL NEED:

- \cdot Homebrewing starter kit for brewing 5 gallon batches
- All-grain equipment kit with a mash tun and hot liquor tank
- Boiling kettle of at least 8 gallons capacity
- Optional 5 gallon carboy, with bung and airlock, to use as a secondary fermenter. NOTE: You may skip the secondary fermentation and add an additional 1-2 weeks to primary fermentation before bottling
- Approximately two cases of either 12 oz. or 22 oz. pry-off style beer bottles

A FEW HOURS BEFORE BREW DAY

Remove the yeast package from the refrigerator, and leave it in a warm place (\sim 70°F) to come to pitching temperature. If you are using Wyeast, smack the pack as shown on the back of the package and allow to swell for at least 3 hours. Do not brew with inactive yeast - contact customer service for advice or a replacement.

MASH SCHEDULE: SINGLE INFUSION

If you are new to all-grain brewing, we suggest starting with 1.5 quarts of water per pound of grain for the strike water volume. This mash thickness can be adjusted for future brews as you become more comfortable with your equipment.

- Saccharification Rest: 150° F
- Mashout: 170° F for 10 minutes (optional) to raise the temperature for mashout, gently apply direct heat while stirring well, or add near boiling water until the target temperature is reached.

Prepare sparge water in your hot liquor tank at a rate of 2 quarts per pound of grain in the recipe, and perform a fly sparge until you have gathered your pre-boil volume (6-7 gallons) in your boil kettle. The sparge should take about an hour for optimal extraction efficiency. You should end up with extra sparge water in your hot liquor tank, you can use this hot water for cleaning later on.

MASH INGREDIENTS - PRE BLENDED

- 10 lbs German Pilsner Malt
- 2 lbs Weyermann Dark Wheat
- 0.75 lb Weyermann Carafa Special III
- 0.25 lb Briess Caramel 60L

HOP ADDITIONS & TIMES

- · 1 oz Perle (60 min)
- 1 oz Hallertau (5 min)

YEAST

Dry Yeast:

Fermentis Safale BE -134. Optimum Temp: 64°- 82°F

Liquid Yeast Options:

- Omega Yeast OYL 500 Saisonstein's Monster. Optimum temp: 65° - 78°F
- Wyeast 3711 French Saison. Optimum temp: 65° 77° F

PRIMING SUGAR

• 5 oz Priming Sugar (save for Bottling Day)

BOIL ADDITIONS AND TIMES	11. Optional - Transfer beer to secondary fermenter. Sanitize
 This recipe calls for a 60 minute boil duration. 1 oz Perle (60 min.) 1 oz Hallertau (5 min.) 	siphoning equipment and an airlock and carboy bung or stopper. Siphon the beer from the primary fermenter into the secondary. If you do not have a secondary fermenter, simply leave the beer in the primary fermenter for an additional two weeks.
AFTER THE BOIL	SECONDARY FERMENTATION - OPTIONAL*
 Cool the wort: When the 60 minute boil is finished, cool the wort to 65° - 75°F as rapidly as possible. Sparitize formation a minute and us put a radiu W/tile the 	12. Allow the beer to condition in the secondary fermenter for 1-2 weeks before proceeding with the next step. Timing now
 Sanitize termenting equipment and yeast pack: while the wort cools, sanitize the fermenting equipment - fermenter, lid or stopper, airlock, funnel, etc - along with the yeast packet. 	and step 11 above.
3. Transfer your cooled wort into the primary fermentation vessel using a valve on the boil kettle, by siphoning from the boil kettle, or pouring the wort into the fermenter.	BOTTLING DAY - ABOUT 1 MONTH AFTER BREWING DAY 13. Sanitize siphoning and bottling equipment.
 Aerate the wort. Seal the fermenter and rock back and forth to spash for a few minutes, or use an aeration system and diffusion stone. 	14. Mix a priming solution (a measured amount of sugar dissolved in water to carbonate the bottled beer). Use the following amounts, depending on which type of sugar you will use:
 Measure specific gravity of the wort with a hydrometer and record in the "BREWER'S NOTES" section. Target gravity for this kit is 1.060. 	 Corn sugar (dextrose) 2/3 cup in 16 oz water. Table sugar (sucrose) 5/8 cup in 16 oz water.
6. Add your yeast once the temperature of the wort is between 65° - 75°F. Sanitize and open the yeast pack and carefully pour the contents into the primary fermenter.	15. Siphon beer into bottling bucket and mix with priming solution. Stir gently to mix—don't splash.16. Fill and cap bottles.
7. Seal the fermenter. Add approximately 1 tablespoon of	
sanitizer or clean water to the sanitized airlock. Insert the airlock into the rubber stopper or bucket lid and seal the fermenter.	17. Condition bottles at room temperature for 2 weeks. After this
8. Move the fermenter to a warm, dark, quiet spot until fermentation begins.	18. Serving. Pour into a clean glass, being careful to leave the layer of sediment at the bottom of the bottle. Cheers!
PRIMARY FERMENTATION	BREWER'S NOTES
9. Active fermentation begins. Within approximately 48 hours of Brewing Day, active fermentation will begin – there will be a cap of foam on the surface of the beer, the specific gravity as measured with a hydrometer will drop steadily, and you may see bubbles come through the fermentation lock. The optimum fermentation temperature for this beer is 65° - 70°F, move the fermenter to a warmer or cooler spot as needed	
 Active fermentation ends. Approximately one to two weeks after brewing day, active fermentation will end. When the cap 	
of foam falls back into the new beer, bubbling in the air lock slows down or stops, and the specific gravity as measured	
with a hydrometer is stable, proceed to the next step.	
At Northern Brewer, we've always got your back. Our Brewmasters are available 7 days a week to help you	

forward to the next one. We'll never let you fail. Guaranteed.
