

Thank you for making the investment in the only solution for mounting your ARB single or dual compressor into your Jeep Cherokee. This mounting design is tailored to pretty much mount anything in your engine bay. Other items can be mounted to this as well. You can even use it to mount the 8 Switch PDC alongside a single ARB compressor.

Tools required for installation:

7/16" wrench

5/32" allen key / hex drive

10mm, 8mm, 7mm open ended wrench depending on model year

Phillips head bit for cordless drill (if necessary)

Step 1:

Utilize the picture in the upper right to preassemble the leftside mounting bracket to the flat deck. Use 3 of the included button head bolts to marry the two together. A washer will be placed on both the top and bottom, followed by the nylon lock nut.

Step 2:

See picture to the right. This is the mounting location of the Utili-Deck. It sandwiches between the PCM and battery tray. There are three bolts/nuts holding the PCM to the battery tray. Remove all three and slide the bracket into place. Please note that the bolt closest to the front of your Cherokee has a ground wire attached to it. Be sure to put it back into place when you reassemble.

Step 3:

The Utili-Deck has an adjustable height feature to accommodate batteries that may not be factory. This adjustment also ensures the deck does not come into contact with the battery terminals found on the top of the battery. On the top right of the deck is a slot that will accompany the adjustable brackets that will marry the right side of the deck to your Jeep. The smaller slotted portion marries to the deck, and the larger slotted portion marries to a factory placed bolt head from your fender. Depending on year, that bolt head may or may not be accessible with the configuration, so we have also included a self tapping screw that will achieve the same success in mounting.

You now have the first and only compressor mount in the world made specifically for the Jeep Cherokee KL. As an integrated feature on the Utili-Deck, you can install any aftermarket battery terminal post extensions directly to it so access to your battery is incredibly simple. The extensions are an awesome feature because you will never have to remove this product to access the power from your battery!
