

Equipment required:

- Syndopour 200-MB base
- Suitable vessel to heat the product in
- Microwave or a suitable heating device
- Stirrer to mix the product when melting
- Thermometer
- Additives if required
- Mould or suitable container to pour the product into once molten
- If planning to slice, a soap wire cutter

Prepare:

Remove the Syndopour base from the packaging and cut the product into smaller pieces to aid melting. Add the prepared product to a suitable vessel which is stable on heating. (Please note this base is soft as supplied but will harden once processed).

Melt:

Melt the product in a microwave or a suitable heating device ensuring that the base melts evenly.

Stirring the product regularly helps to do this.

Recommended heating temperature should be around 80°C

Please note – When molten the base clears but will return opaque upon setting.

Create:

Once the base is molten, additives such as fragrance, colour and any additional hair care agents can be added to customise the base. Simply add the chosen additives to the molten product and mix to ensure even distribution. It is recommended that the level of additives included is up to 3 % maximum. This level would include up to 2 % fragrance. Stability testing may be required ensure compatibility.

Pour:

Pour the molten product into a mould or suitable container between 70 - 85 °C and allow to set.

hello@stephensonpersonalcare.co.uk

Remove:

Once the Syndopour base has set, remove the product from the mould or suitable container, allow time for the base to set. The bars will release more easily if it has been left for 24 hours in a cool place.

Please note – Once unmoulded, the base will continue to harden overnight.

Once hard, package as required. If the finished product is to be sliced, we recommend using a soap wire cutter.

Please note – due to the glycerin present in the base, this base can be prone to sweating.
